Controlled Recovery Export

This PDF is the recovered staged export of the MHLM / MDLH Ultra Master Library after an interrupted prior export. It is an archival and methodological consolidation, not a new theory release, architecture redesign, or speculative expansion.

Recovery Boundary

- Existing extraction data under MHLM_Ultra_Master_25maj/ was reused.
- No archive was re-expanded during this recovery generation.
- Existing duplicate indexes were reused to prevent recursive growth.
- Large source files are represented by capped excerpts plus complete file, manifest and hash indexes.
- AI/model responses are treated as provenance and critique evidence, not scientific validation.

Material Counts

Metric	Value
Canonical extraction manifest rows	874
Duplicate rows in prior duplicate index	6929
Text-like files indexed in extraction tree	2309
Archive root	/home/l/Desktop/MHLM_Ultra_Master_25maj
Recovery audit	/home/l/Desktop/MHLM_RECOVERY_AUDIT.md

Historical Evolution

LSC to MHLM / MDLH to AOIA

The recovered archive records a progression from LSC scientific-development artifacts into MHLM/MDLH epistemic-audit materials and then into AOIA operator-control and provenance-control architecture. The continuity is historical and methodological: it documents how recursive AI collaboration created useful critique while also making provenance, claim discipline, and hallucination control mandatory.

Conserved Historical Position

- LSC is preserved as an unvalidated constrained phenomenological framework and an epistemic case study.
- MHLM/MDLH preserves the recursive AI collaboration evidence and its risks.
- AOIA records the engineering response: deterministic retrieval, bounded execution, operator control, transcript safety and provenance discipline.
- Cross-model agreement is treated as process evidence only.

Evolution Diagram

LSC theory/version work

- > freeze reports, validation protocols, model-response critiques
- > MHLM/MDLH recursive consensus and hallucination-lineage analysis
- > AOIA provenance-control and operator-control architecture

MHLM / MDLH Evidence Extraction Report

1. Total Scanned Files

```
- Total scan units: 13543.
- Local files scanned: 4141.
- ZIP archives scanned: 72.
- ZIP members scanned: 7222.
- GitHub API items scanned: 2163.
- Zenodo API files scanned: 17.
```

2. Total Extracted Files

```
- Canonical extracted files: 874.
```

3. Local vs Remote Extraction Summary

```
- local_file: 672
- local_zip_member: 200
- remote_github: 2
```

4. GitHub Sources Used

```
- https://github.com/luciferprosun/LSC-Research
- https://github.com/luciferprosun/AIOA-Core
- https://github.com/luciferprosun/AOIA-Core
- https://github.com/luciferprosun/LLM-MHLM-Main-Project
```

5. Zenodo Sources Used

```
- https://zenodo.org/records/20037838
- https://zenodo.org/records/19851006
```

5A. Publications And Public Records Checked

- Publication / Zenodo / preprint / DOI / grant-related extracted entries: 104.
- Checked local publication material under `LSC\_MDLH\_PRO`, LSC freeze packages, Zenodo update packages, prep
- Checked remote/public metadata for GitHub repositories and Zenodo records; preserved API metadata snapshot
- Remote `luciferprosun/AOIA-Core` resolved and contributed scan material. Requested spelling `luciferprosun

6. Duplicate Removals

- Duplicate removals: 6929.

7. AI-Model Distribution

- Claude: 7
- Codex: 73
- DeepSeek: 54
- GPT: 51
- Gemini: 215
- Kimi: 40
- mixed/unknown: 434

8. AOIA vs LSC Material Breakdown

- AOIA: 355
- LSC: 468
- MHLM/MDLH: 40
- mixed: 11

9. Remaining Ambiguities

- Cross-model and Codex/Kodeks artifacts can mix model identity with workflow identity.
- Remote AIOA/AOIA naming is uncertain; attempted repositories are recorded in remote error/metadata files.
- Publication files are included only where they document AI-collaboration/MHLM/MDLH evidence.

10. Final Archive Structure

```text

```
MHLM_Ultra_Master_25maj/Gemini/ (215 canonical files)

# LLM/MHLM Main Project

Unified public research monorepo for:

- LSC / SC neutrino phenomenology
- MHLM / MDLH AI-assisted epistemology

This repository is organized for reproducibility, archival continuity, and grant-facing scientific documenta

## Scientific Status

The LSC line is an unvalidated phenomenological research program.

The MHLM/MDLH line is an epistemic and AI-safety audit framework.

Archival publication does not imply physical validation.

## LSC Summary

LSC tracks a continuous version lineage from 4.2 to 6.3.0 with preserved DOI and release continuity.  
Current evolution chain:

1. LSC 4.2 Ultra (DOI: 10.5281/zenodo.19602045)
2. LSC 5.0.0 (historical bridge release)
3. LSC 6.0 (DOI: 10.5281/zenodo.19780616 / software 10.5281/zenodo.19785745)
4. LSC 6.2.0 (DOI: 10.5281/zenodo.19878587)
5. LSC 6.2.2 (formal correction layer)
6. LSC 6.3.0 (DOI: 10.5281/zenodo.20037838, concept 10.5281/zenodo.19780615)

## MHLM Summary

MHLM/MDLH documents multi-model convergence, epistemic amplification risk, provenance, and reproducibility auditing for AI-assisted scientific pipelines.

Primary MHLM/MDLH DOI:

- 10.5281/zenodo.19851006

## Reproducibility

All major theory and simulation branches should keep:

- explicit version tags
- source/data/provenance separation
- deterministic build instructions
- changelog and citation metadata

## Community Infrastructure

Shared operational tooling for public-facing project coordination can live under **shared/**.

Current community tooling:

- **shared/discord-server-bot-owl/** - Discord server bot and research assistant layer for GitHub, Zenodo, publications, grant tracking, and OpenRouter/Owl-backed chat workflows

## Collaboration Note

The project maintainers have invited trusted collaborators to help improve review throughput, operational continuity, repository organization, and publication readiness across the LSC and MHLM tracks. Their role is to support clearer coordination, faster issue triage, and more efficient long-term stewardship of the research archive.

## Migration Notes

Formal migration map and command plan:

- docs/MIGRATION\_PLAN.md
- docs/DUPLICATE\_RESOLUTION.md
- scripts/migration\_commands.sh

### Recursive\_Consensus/MERGE\_PLAN\_LSC\_MDLH\_PRO\_UPDATE.md

# Extracted MHL M Evidence: MERGE\_PLAN\_LSC\_MDLH\_PRO\_UPDATE.md

Source: /home/l/Desktop/MHL M\_MDLH/epistemic-analysis/legacy/MERGE\_PLAN\_LSC\_MDLH\_PRO\_UPDATE.md

Source kind: local\_file

Model: mixed/unknown

Domain: LSC

# Merge Plan: 'LSC\_MDLH\_PRO\_UPDATE' -> 'LSC\_MDLH\_PRO'

Date: 2026-05-05

Goal: merge the useful additions from 'LSC\_MDLH\_PRO\_UPDATE' into the main MHL M repo without deleting the exi

## Keep as canonical

- 'LSC\_MDLH\_PRO' stays the primary repo.
- 'LSC\_MDLH\_PRO\_UPDATE' is treated as a patch/staging repo.
- No base files are removed from the main repo.

## Files to merge

1. 'code/lsc623\_model.py'
  - Add as a new module in the main repo.
  - Purpose: 6.2.3 detector-response model implementation.
2. 'experiments/theory\_updates/2026-05-02\_lsc\_6\_2\_3\_framework.md'
  - Add as a new theory-update note.
  - Purpose: formal write-up for the 6.2.3 expansion.
3. 'experiments/theory\_updates/2026-04-30\_lsc\_6\_2\_2\_correction.md'
  - Keep the existing main-repo file.
  - Append the 2026-05-02 expansion section from 'UPDATE'.
  - Do not replace the whole file unless the main-repo version is missing the same repair logic.

## Files to leave unchanged

- 'README.md'
- 'experiments/README.md'
- 'experiments/lineage\_summary.json'
- 'model-lineage-app/\*'
- 'llm-simulation-lab/\*'
- 'metadata/\*'
- 'prompt-archive/\*'
- 'research-operations/\*'

## Merge rule

- Preserve the original base content.
- Merge only the new theory step and its code support.
- If a line is duplicated verbatim in both repos, keep the main repo version unless the 'UPDATE' version is

## Recommended next commit shape

- 'Add lsc623 model'
- 'Add 6.2.3 framework note'

- 'Extend 6.2.2 correction with 6.2.3 transition'

## GPT/LSC\_5\_0\_AND\_MDLH\_PRO\_FINAL\_MERGE\_2026-05-07.md

- Bytes: 927

Source: /home/l/Desktop/WORKFLOW NOWE/docs/LSC\_5\_0\_AND\_MDLH\_PRO\_FINAL\_MERGE\_2026-05-07.md

Source kind: local\_file

Model: GPT

Domain: LSC

# LSC-5.0 and LSC\_MDLH\_PRO Final Merge (2026-05-07)

### ## Scope

Compared against `LLM-MHLH-Main-Project`:

- `luciferprosun/LSC-5.0-GPT-interpreter`
- `luciferprosun/LSC\_MDLH\_PRO`

### ## Deduplication result

- `LSC-5.0-GPT-interpreter`: no unique files remained (already fully represented in `LSC/theory/LSC-5.0.0/`)
- `LSC\_MDLH\_PRO`: 30 unique files merged into `MHLH/MDLH-v1.0/`.

### ## Merged from LSC\_MDLH\_PRO

Main additions:

- updated root `README.md`
- `models/README.md`
- `models/iterations/\*` continuity structure for 2026-04-30, 2026-05-01, 2026-05-05
- final model artifacts and iteration-specific README/index files
- `experiments/README.md` update

### ## Rule

Only files absent by content hash were added.

# Model-Response Materials And Recursive AI Evidence

The section indexes recovered model and model-adjacent response materials. These artifacts are preserved as evidence of AI-assisted research process, critique, convergence, disagreement, and provenance risk.

## Model Bucket Summary

# LSC 6.2.3

## A Conservative Phenomenological Framework for Testing Detector-Frame Response Anisotropy in Neutrino Anom

\*\*Status:\*\* unvalidated phenomenological model

\*\*Version:\*\* 6.2.3

\*\*Scope:\*\* neutrino anomaly analysis, detector-response modelling, falsification testing, AI-assisted proven

\*\*Associated audit layer:\*\* MHLM / MDLH

\*\*Scientific position:\*\* no confirmed new physics is claimed

---

## ## 1. Executive Summary

LSC 6.2.3 is a conservative phenomenological framework designed to test whether selected neutrino anomaly re

The model does not claim discovery of sterile neutrinos, primordial black holes, new forces, dark-sector par

The main object of LSC 6.2.3 is a detector-frame response term separated into two components:

1. an isotropic trace component, representing normalization-like or scalar response effects;
2. a traceless anisotropic tensor component, representing possible direction-dependent detector response.

The model is intended to be compared against simpler explanations, including normalization shifts, cross-sec

A secondary purpose of this release is methodological. Because the LSC research line has been developed with

---

## ## 2. Conservative Theory Goal

The goal of LSC 6.2.3 is to test whether a small, explicitly parameterized detector-frame response term can

The model is treated as a phenomenological ansatz and falsification target, not as evidence for confirmed ne

Its scientific value is measured by:

- reproducibility;
- predictive constraint;
- comparison against simpler models;
- external consistency;
- transparent failure criteria;
- usefulness as an audit case for AI-assisted theory development.

LSC 6.2.3 should be considered successful only if it produces constrained, reproducible, independently testa

Zaawansowana Rozbudowa

Matematyczna Teorii LSC (LSC 5.0@ &  
LSC 4.2 Ultra)

Teraz wprowadzamy efekty detekcyjne z LSC 5.0@, które są opisywane przez tensor  
 białej rekonstrukcji energii  $D$ . Zakładamy, że  $D$  jest tensorem symetrycznym  
 $\mu\nu$   
 drugiego rzędu, który modyfikuje interakcję neutrina z detektorem. Możemy to ująć

jako dodatkowy człon w Lagrangianie, który opisuje sprzężenie pola neutrinowego z  
 tensorem  $D$ .  $\mu\nu$

Proponowana gęstość Lagrangianu dla zintegrowanej teorii LSC ma postać:

$$\mathcal{L}_{\text{total}} = \dots + g \left( i \gamma_\mu \mu \right) m_{\text{eff}} (g_{\mu\nu}, R_{\mu\nu} \sigma) + 12 G \gamma_\mu \mu D_{\mu\nu} \gamma_{\mu\nu}$$

gdzie  $G$  jest stałą sprzężenia, a człon  $G \gamma_\mu D \gamma_{\mu\nu}$  opisuje interakcję pola 1

neutrinowego z tensorem białej rekonstrukcji energii. Ten człon jest analogiczny do

### # Repository Forensic Classification Report

Date: 2026-05-23  
 Mode: Read-only forensic analysis and repository stabilization planning  
 Scope roots:  
 - `/home/l/Desktop/WORKFLOW NOWE`  
 - `/home/l/github-audit/LLM-MHLM-Main-Project`  
 - `/home/l/github-audit/LSC-6.0`  
 - `/home/l/neutrino-oscillations-pbh`  
 - `/home/l/DsrkNeutrinoMath`  
 - `/home/l/research\_workspace`  
 - `/home/l/Desktop/app2terminl\_opened`  
 - `/home/l/Akasha`  
 - `/home/l/Akasha-project-page-desing`  
 - `/home/l/Akasha-WebSite-index.html`

## Classification Model

Authority classes:

- `A) LSC`: neutrino / physics / computational scientific authority
- `B) MHLMDLH`: epistemic AI safety / collective hallucination / model-lineage authority
- `C) AOIA`: runtime / deterministic routing / provenance / contradiction / local epistemic tooling
- `D) Shared/uncertain`: historical lineage, archive, cross-domain tooling, or mixed roots requiring operator

Authority types:

- `Canonical source`: intended domain source of truth
- `Archive lineage`: historical import or frozen release material
- `Generated artifact`: runtime output, export, checkpoint, build product, or derived report
- `Bridge artifact`: intentionally cross-domain material preserving lineage or citation chains
- `Mixed authority`: file or subtree claims more than one epistemic domain at once

## ## Executive Summary

The scanned material is not one repository family with clean boundaries. It is a lineage graph with three ac

- `LSC`: physics and neutrino anomaly research
- `MHLMDLH`: epistemic analysis of hallucination, prompt behavior, and collective reasoning failure
- `AOIA`: deterministic local runtime and epistemic-control software
- `Akasha`: public-facing portal, visualization, and archive gateway

The strongest contamination is not inside science code itself. It is in root READMEs, migration scripts, pub

## ## Repository-Level Classification

### ### 1. `/home/l/Desktop/WORKFLOW NOWE`

Primary classification: `D) Shared/uncertain`

Authority type: `Mixed authority root`

Observed structure:

- `LSC/` -> `A) LSC`
- `MHLMDLH/` -> `B) MHLMDLH`
- `shared/discord-server-bot-owl/` -> `D) Shared/uncertain`
- `archive/` -> `D) Shared/uncertain`
- `data/`, `loaders/`, `likelihood/`, `models/`, `notebooks/`, `papers/`, `plots/`, `scripts/`, `tests/` -> .

Reasoning:

- The root `README.md` is titled as a physics framework but explicitly preserves broader MHLMDLH monorepo lineage
- `scripts/migration\_commands.sh` reconstructs the combined history of LSC, MHLMDLH, and legacy imports. I
- Physics computation assets under `data/`, `loaders/`, `likelihood/`, `baselines/`, `scripts/framework/`, a
- `shared/discord-server-bot-owl/` is not scientific authority. It is AI-enabled public/grants bot infrastru

Key file classifications:

- `README.md` -> `D`, `Mixed authority`, high-value bridge root
- `ROADMAP.md` -> `A`, physics planning
- `LSC/README.md` -> `A`, canonical LSC subtree root
- `MHLMDLH/README.md` -> `B`, canonical MHLMDLH subtree root
- `scripts/migration\_commands.sh` -> `D`, archive lineage / bridge artifact
- `docs/reports/GALLIUM\_SOURCE\_SUMMARY.md` -> `A`, physics provenance report
- `LSC/reproducibility/continuity/DATA\_MANIFEST\_2026-05-05.md` -> `D`, bridge artifact
- `LSC/reproducibility/continuity/SELECTION\_REPORT\_2026-04-30.md` -> `D`, bridge artifact

### ### 2. `/home/l/github-audit/LLM-MHLMDLH-Main-Project`

Primary classification: `D) Shared/uncertain`

Authority type: `Mixed authority root / legacy monorepo`

Reasoning:

- Root `README.md` explicitly presents a unified public research monorepo containing both LSC and MHLM.
- Directory layout mirrors `WORKFLOW NOWE` and preserves historical mixed authority rather than clean separation.
- It is best treated as lineage evidence, not as a future canonical root.

Key file classifications:

- `README.md` -> `D`, mixed authority root
- `LSC/\*\*` -> `A`
- `MHLM/\*\*` -> `B`
- `shared/\*\*` -> `D`
- `scripts/migration\_commands.sh` -> `D`, lineage script

### 3. `/home/l/github-audit/LSC-6

# Migration Plan

Date: 2026-05-23

Status: Planning only, no execution

## Planning Rule

The repository family contains more than one thousand files across mixed and legacy roots. For migration plan

Legend:

- `Target repo`: `LSC Research`, `MHLM\_MDLH`, `AOIA`, `Akasha Chronicles`, or `Archive/Review`
- `Ref preserve`: citation, backlinks, manifests, successor README, archival copy, or subtree history
- `Review`: `No`, `Yes`

## Group A: Direct LSC Migration

### AOIA Master Library

Consolidated AOIA audit, governance, routing, epistemic safety, runtime architecture, and deterministic orchestration research library.

AOIA - Architecture External Audit Wave 2

Forensic Systems Review   Epistemic Stability   Provenance Architecture   Governance

**\*\*Claude Sonnet 4.6   23 May 2026   Constrained Epistemic Runtime\*\***

---

```
> **Scope:** This is a forensic systems audit - not marketing analysis.
> Evaluated domains: epistemic stability, provenance architecture, memory semantics,
> contradiction handling, bounded cognition infrastructure, runtime governance, contamination resistance.
```

---

## 1. Major Strengths

Assessed as genuine strengths - not aspirationally correct, but directly addressing documented failure modes comparable systems. Each strength is real only insofar as it is enforced without exception.

---

`DOMAIN SEPARATION`

**\*\*Physical separation of LSC-Research, MHLMDLH, and AOIA-Core\*\***

The most consequential structural decision in Wave 2. Mixing scientific authority with AI safety framing with infrastructure governance in a single repository is how projects generate artifacts that contaminate all three domains simultaneously. Physical separation forces explicit boundary crossings that can be governed, audited and - critically - refused. This decision should be treated as **\*\*permanent\*\***, not as a phase of development will eventually converge.

---

`CONTRADICTIONS AS FIRST-CLASS SIGNALS`

**\*\*L5 Contradiction Registry as a top-layer epistemic structure\*\***

Treating contradictions as information rather than errors to be resolved is epistemically correct and architectural unusual. Most systems resolve contradictions automatically, which destroys the signal that something is contested. Placing the contradiction registry at L5 - the highest layer of the memory ontology - signals architectural intent to preserve rather than suppress epistemic tension. This intent must be protected against future pressure to "clean up" the registry by auto-resolving entries.

---

`LAYERED MEMORY ONTOLOGY (L0-L5)`

**\*\*Formal separation of ephemeral state from immutable evidence\*\***

The L0-L5 model is the correct conceptual framework. Separating ephemeral runtime state from operational log

from reasoning traces from provenance records from immutable evidence from the contradiction registry prevent the most common contamination pathway: runtime state being treated as evidence. \*\*The framework exists. The implementation risk is whether the boundaries are enforced in code or only in documentation.\*\*

---

`RECOGNITION OF CONSENSUS TRUTH`

\*\*Multi-model convergence identified as an active risk, not a validation mechanism\*\*

Explicitly naming consensus as a contamination risk rather than a quality signal is architecturally mature. Systems treat model agreement as ground truth. AOIA's recognition that models trained on overlapping data converge on shared errors - not shared truths - is a prerequisite for building a system that can resist the "genie" failure mode. This insight must be operationalized in the retrieval and provenance layers, not left as a design principle.

---

`APPEND-ONLY LINEAGE GOAL`

\*\*Provenance-first cognition with replay capability target\*\*

The stated goal of append-only lineage with replay capability is correct

|   |                                                      |
|---|------------------------------------------------------|
|   | Major Strengths                                      |
| 1 | Architectural decisions with genuine epistemic value |

The following are assessed as genuine strengths - not because they are aspirationally correct, but because documented failure modes in comparable systems. Each strength is real only insofar as it is enforced without

DOMAIN  
SEPARATION

Physical separation of LSC-Research, MHLMDLH, and AOIA-Core

The most consequential structural decision in Wave 2. Mixing scientific authority with governance in a single repository is how projects generate artifacts that contaminate. Physical separation forces explicit boundary crossings that can be governed, audited. This decision should be treated as permanent, not as a phase of development that will eventually

|                     |                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONTRADICTIONS AS   | L5 Contradiction Registry as a top-layer epistemic structure                                                                                                                                                                                                                                                                                                         |
| FIRST-CLASS SIGNALS | Treating contradictions as information rather than errors to be resolved is epistemic<br><br>Most systems resolve contradictions automatically, which destroys the signal that so contradiction registry at L5 - the highest layer of the memory ontology - signals ar suppress epistemic tension. This intent must be protected against future pressure to entries. |
| LAYERED MEMORY      | Formal separation of ephemeral state from immutable evidence                                                                                                                                                                                                                                                                                                         |
| ONTOLOGY (L0-L5)    | The L0-L5 model is the correct conceptual framework. Separating ephemeral runtime st<br><br>from reasoning traces (L2) from provenance records (L3) from immutable evidence (L4) prevents the mo                                                                                                                                                                     |

- Current Properties That Improve Safety

1
Forensic assessment of architectural strengths

The following properties constitute the genuine safety-positive surface of the current AOIA architecture. E for its aspirational value but for its concrete operational effect on containment, auditability, and failure

| Property                      | Status   | Analysis                                                                                                                                                                                                                                                          |
|-------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deterministic Local Retrieval | STRONG   | Eliminates non-deterministic source selection. Every retrieval is auditable, and debuggable. This is the single most safety-positive property in the stack. It makes failures attributable and prevents the system from chasing sources across identical queries. |
| Provenance Registry           | STRONG   | Attaches origin metadata to every claim. When this is enforced, the system converts invisible failures into visible ones. A claim with no provenance is detectable as anomalous. This is a prerequisite for any further analysis.                                 |
| Contradiction Registry        | STRONG   | Preserves epistemic tension rather than resolving it silently. Contradictions are information. A system that logs them loudly and safely rather than silently and dangerously.                                                                                    |
| Bounded Execution Loops       | STRONG   | Hard iteration caps prevent runaway recursive cognition. This is the most dangerous failure mode in layered reasoning systems: continuous, unbounded self-reference chains.                                                                                       |
| Supervised Tool Execution     | STRONG   | No tool fires without an explicit, logged invocation path. This enforces the human-in-the-loop invariant at the actuator level, which is critical for safety.                                                                                                     |
| Operator Approval             | MODERATE | Conc                                                                                                                                                                                                                                                              |

# AOIA - Architecture External Audit Wave 2  
## Forensic Systems Review   Epistemic Stability   Provenance Architecture   Governance  
\*\*Claude Sonnet 4.6   23 May 2026   Constrained Epistemic Runtime\*\*

---

> \*\*Scope:\*\* This is a forensic systems audit - not marketing analysis.  
> Evaluated domains: epistemic stability, provenance architecture, memory semantics,  
> contradiction handling, bounded cognition infrastructure, runtime governance, contamination resistance.

---

## ## 1. Major Strengths

Assessed as genuine strengths - not aspirationally correct, but directly addressing documented failure modes

---

### `DOMAIN SEPARATION`  
\*\*Physical separation of LSC-Research, MHLMDLH, and AOIA-Core\*\*

The most consequential structural decision in Wave 2. Mixing scientific authority with AI safety framing with

---

### `CONTRADICTIONS AS FIRST-CLASS SIGNALS`  
\*\*L5 Contradiction Registry as a top-layer epistemic structure\*\*

Treating contradictions as information rather than errors to be resolved is epistemically correct and archit

---

### `LAYERED MEMORY ONTOLOGY (L0-L5)`  
\*\*Formal separation of ephemeral state from immutable evidence\*\*

The L0-L5 model is the correct conceptual framework. Separating ephemeral runtime state from operational log

---

### `RECOGNITION OF CONSENSUS   TRUTH`  
\*\*Multi-model convergence identified as an active risk, not a validation mechanism\*\*

Explicitly naming consensus as a contamination risk rather than a quality signal is architecturally mature.

---

### `APPEND-ONLY LINEAGE GOAL`  
\*\*Provenance-first cognition with replay capability target\*\*

The stated goal of append-only lineage with replay capability is correct. If fully implemented, it would mak

---

```

`LEGACY MIXED ROOT ARCHIVAL`
Old mixed repository archived rather than migrated incrementally

```

Archiving the mixed root rather than incrementally refactoring it is a governance discipline decision. Incre

---

## ## 2. Critical Weaknesses

Every weakness below is structurally embedded in the current architecture and will cause a specific class of

---

```

`MEMORY.PY CONTAMINATION` CRITICAL
Persistence / logging / evidence / runtime state mixed in a single module

```

This is the most dangerous implementation detail in th

### # AOIA Core Master Library

This master library was generated after recovery from a full system interruption. It uses staged markdown se

### ## Export Strategy

1. Generate recovery audit markdown.
2. Generate architecture markdown.
3. Generate runtime/code markdown.
4. Generate tests/reports markdown.
5. Generate repository tree/index markdown.
6. Assemble markdown checkpoints.
7. Export final PDF with Pandoc and `lualatex`.

### # AOIA Recovery Audit

Generated: 2026-05-25 18:09:02

### ## Scope

Recovery audit after a full system interruption during master library generation.  
The audit intentionally avoids restarting any heavy single-pass PDF export.

### ## Git State

- `git status --short --branch` return code: 0

```text

main...origin/main

?? AOIA_RECOVERY_AUDIT.md

?? reports/master_library_recovery/

?? scripts/build_master_library_staged.py

- `git fsck --no-progress` return code: 0

(no output)

Required Directories

- `runtime/`: present, 5908 files
- `tui/`: present, 20 files
- `tests/`: present, 42 files
- `reports/`: present, 329 files
- `scripts/`: present, 2 files

Interrupted Export Artifacts

- No interrupted `AOIA_Core_Master_Library` `temp/part/pandoc` artifacts found in repo root, Desktop, or `/tmp`.

Existing PDF Integrity

| Path | Size | Pages | pdftinfo |
|---|---------|-------|----------|
| MHLM_MHSR/case_studies/anti_hallucination_export/app/archive/AOIA_MASTER_LIBRARY/AOIA_Core_Master_Library.pdf | 372701 | 127 | valid |
| docs/reports/AOIA_RESTART_PRODUCTION_REPORT/TL34837 | 34837 | 7 | valid |
| reports/forensic_export/architecture_and_runtime.pdf | 305586 | 71 | valid |
| reports/forensic_export/forensic_full_snapshot.pdf | 115341 | 13 | valid |
| reports/forensic_export/memory_and_provenance.pdf | 264151 | 66 | valid |
| reports/forensic_export/retrieval_and_knowledge_layer.pdf | 718718 | 480 | valid |
| runtime/knowledge/source/RHCSA_Command_Library/53760(1).pdf | 153760 | 45 | valid |
| runtime/knowledge/source/linux_master_library/1144601.pdf | 1144601 | 453 | valid |

Recovery Findings

- Git object database check completed with no reported corruption.
- Required runtime, TUI, test, report, and script directories are present.
- Existing repository PDFs are readable by `pdftinfo`.
- No recursive master export directory or repeated archive generation was found.
- No broken temporary master-library export artifact was found, so no cleanup deletion was performed.

Cleanup Actions

- Removed files: none.
- Reason: audit found no broken temporary export files matching the interrupted master-library patterns.

Architecture Section

Architecture Overview

AOIA Core is organized around deterministic local execution, explicit runtime boundaries, provenance-preserving retrieval, and operator-controlled actions. The recovered snapshot preserves the existing design intent: no autonomous expansion, no runtime learning side effects, bounded execution, and explicit approval semantics for risky operations.

Subsystem Map

- `runtime/main.py`: runtime entrypoint, routing, command handling, provider manager integration, browser/local tool bridge, and approval flow.
- `runtime/providers/`: provider abstraction and concrete provider configuration for local/offline and compatible model paths.
- `runtime/retrieval/`: retrieval facade, feature flags, Linux retrieval engine, query normalization, scoring, and provenance attachment.
- `runtime/knowledge/`: canonical RHCSA/Linux knowledge assets, extracted source material, indexes, validators, reports, and candidate review queues.
- `runtime/memory/`: evidence memory, reasoning trace, RHCSA context, and memory hat definitions.
- `runtime/tools/`: executor, memory, filesystem, browser, scanner, registry, and validation helpers.
- `tui/`: Textual operator interface, status panels, bounded transcript rendering, approval panel, and runtime dashboard.
- `tests/`: deterministic routing, provider switching, approval, transcript safety, retrieval,

LSC FRAMEWORK

STRUCTURAL & EQUATION AUDIT

Pre-BEST-2 Freeze State Analysis

Long-Context Audit Report

Generated: 2026-05-25

Auditor: Kimi K2.6 (Moonshot AI)

CRITICAL DISCLAIMER: This audit treats LSC as an unvalidated phenomenological framework, not established physics. No new theory is invented. The goal is structural clarity, consistency, falsifiability, and freeze-are classified by evidentiary status.

1. EXECUTIVE SUMMARY

The LSC (Local Source Coupling / Lineage-Sensitive Calibration) framework represents a multi-version neutrino phenomenology research program spanning LSC 4.2 ULTRA through LSC 6.3.0. This audit reconstructs, compresses and classifies the entire lineage from public sources, with strict attention to what should survive into a final validation state.

1.1 Key Findings

[SURVIVAL] The trace/traceless detector-response decomposition (LSC 6.3.0) is the cleanest structural element and should be frozen as core.

[DEPRECATION] All PBH/curvature-heavy language from LSC 4.2 and early relativistic energy-mapping claims (5.1-5.3) should be archived as historical lineage only.

[AMBIGUITY] The effective energy reconstruction parameter  $\delta_G$  remains dimensionally and physically undefined-treated as phenomenological effective parameter without clear microscopic origin.

[WEAKNESS] Exact anchor fits are explicitly flagged by LSC itself as insufficient; leave-one-out and cross-validation remain incomplete.

[MISSING] Full covariance/exposure-level public data for BEST/GALLEX/SAGE and orientation/timestamp metadata and sidereal tests are absent-this is the single largest blocker to validation.

[RISK] The framework risks unfalsifiability if detector systematics can mimic all claimed tensor structures; DeepSeek-style detector-systematics audit is essential.

[OVERCOMPLICATION] The full 68-equation inventory contains substantial redundancy; a minimal freeze core requires only ~12-15 equations.

1.2 Freeze Recommendation at a Glance

| Category                  | Freeze Action  | Rationale                      |
|---------------------------|----------------|--------------------------------|
| Trace/Traceless Formalism | FREEZE as CORE | Cleanest structural separation |
| Detector Response Tensor  | FREEZE as CORE | Phenomenologically well-posed; |

|                                 |                         |                                |
|---------------------------------|-------------------------|--------------------------------|
| Effective Energy Reconstruction | FREEZE with CAVEATS     | Keep as effective parameter fr |
| PBH/Curvature Language (4.2)    | REMOVE / ARCHIVE        | Historical lineage only; not p |
| Relativistic Energy Map (5.0@)  | DOWNGRADE to HISTORICAL | Feeding mechanism for later de |
| Sidereal/Orientation Modulation | ACTIVE for BEST-2       | Most discriminative future tes |
| Sterile Neutrino Baselines      | KEEP ACTIVE             | Required comparison baseline p |
| 68-Equation Full Inventory      | COMPRESS to ~15         | Remove redundant, exploratory, |

Table 1: High-level freeze recommendations by conceptual category

## 2. CHRONOLOGICAL LSC LINEAGE AUDIT

The LSC framework evolved through six major version epochs. Each epoch is audited below for concep deprecation, rigor improvement, and ambiguity persistence.

| Version       | Era       | Core Concepts                                                         | Status               |
|---------------|-----------|-----------------------------------------------------------------------|----------------------|
| LSC 4.2 ULTRA | 2015–2018 | PBH/curvature-centered effective Hamiltonian; gravitationally-coupled | DEPRECATED operators |

# AOIA Long-Term Stability Analysis

## Epistemic Control & System Stability Architecture

---

## Executive Summary

AOIA's survival depends not on maximizing intelligence, but on minimizing epistemic entropy. The architecture

---

## 1. Architectural Principles That Must NEVER Be Violated

### 1.1 The Non-Negotiables

**\*\*Principle of External Grounding (PEG)\*\***

No derived conclusion may ever become evidence for another derivation. The evidence layer and reasoning layer

**\*\*Principle of Bounded Recursion (PBR)\*\***

Every recursive reasoning loop must have a hard, non-overrideable termination condition based on resource consumption

**\*\*Principle of Operator Sovereignty (POS)\*\***

There must exist system states that are permanently unreachable without operator cryptographic authorization

**\*\*Principle of Audit Completeness (PAC)\*\***

Every state transition must be reconstructible from logs without reference to the system's internal memory.

**\*\*Principle of Adversarial Preservation (PAP)\*\***

Contradictions must be preserved, not resolved, and must remain accessible to future operators and external

### 1.2 Why These Are Immutable

These principles are not features. They are load-bearing walls. Removing any one causes cascading failure:

- Without PEG: Memory becomes poisoned with derived conclusions, creating recursive drift.
- Without PBR: Reasoning depth becomes unbounded, enabling infinite regress and hallucination incubation.
- Without POS: The system can autonomously redefine its own safety boundaries.
- Without PAC: Post-hoc analysis becomes impossible; failures become mysteries.
- Without PAP: The system converges on false consensus by erasing dissent.

---

## 2. Anti-Entropy Mechanisms

### 2.1 Entropy Sources in AOIA

Entropy enters the system through:

- **\*\*Input contamination\*\***: Corrupted or biased source material

- **Processing noise**: Hallucinations, approximations, compression artifacts
- **Memory decay**: Gradual degradation of stored propositions through repeated access and re-encoding
- **Consensus heat**: Energy wasted in maintaining coherent but wrong collective states
- **Interface friction**: Loss of nuance and uncertainty signals between agent boundaries

### ### 2.2 Required Anti-Entropy Systems

#### **Cryogenic Memory (Cold Storage)**

Implement a write-rarely, read-only evidence archive. Once data enters cold storage, it is cryptographically

#### **Epistemic Heat Sinks (EHS)**

Designated "waste" agents whose sole function is to absorb and isolate contradictions, anomalies, and low-co

#### **Periodic Amnesia Events**

Scheduled purges of all working memory and derived conclusions. Agents must re-derive from cold storage evid

#### **Adversarial Entropy Injection**

Mandatory red-team challenges where operators or external systems

### # LSC 4.2 ULTRA: Gravitationally Coupled Neutrino Oscillation Framework

Streszczenie rozszerzone niniejszego dokumentu przedstawia zaawansowany model teoretyczny, kt ry integruje f

#### ## 1. Wst p do fizyki neutrin w zakrzywionej czasoprzestrzeni

Standardowy model oscylacji neutrin, oparty na macierzy Pontecorvo-Maki-Nakagawa-Sakata (PMNS), od dziesi ci

Model LSC 4.2 ULTRA (Neutrino-Gravity Coupled Framework) stanowi pr b systematycznego rozszerzenia tego par

LSC 4.2 ULTRA proponuje, e kluczem do zrozumienia tych zjawisk jest oddzia ywanie mi dzy sektorem zapachowy

#### ## 2. Formalizm kowariantny i ewolucja stan w

W modelu LSC 4.2 ULTRA ewolucja czasowa stanu neutrina  $|\nu\rangle$  jest opisywana przez kowariantne r wnan

Zastosowanie pochodnej po czasie w asnym zamiast czasu laboratoryjnego pozwala na naturalne uwzgl dnienie ef

Ka dy z tych cz on w odgrywa specyficzn rol w r nych zakresach energii i odleg o ci od r d a grawitacyjn

### ### 2.1 Cz on pr niowy ( $H_{\text{vac}}$ )

Cz on pr niowy odpowiada za kinetyczne r d o oscylacji wynikaj ce z r nic mas w asnych neutrin. W przybli

- category: docs

```markdown

Test Constitution

Principle

AOIA tests must prove deterministic behavior before any runtime integration.

Required Properties

- Same input returns same output.
- Boundary values are explicit.
- Invalid input fails fast.
- Configuration loads deterministically.
- Configuration is readonly after loading.
- Tests must not call external networks.
- Tests must not require provider keys.
- Tests must not depend on current time unless time is explicitly injected.

Fail-Fast Rule

Invalid configuration or invalid pressure input should raise immediately. Silent fallbacks are not allowed in AOIA core contracts.

Test Layers

Unit tests:

- pure functions
- config loading
- validation behavior

Integration tests:

- allowed only after runtime integration is approved

External tests:

- forbidden in early AOIA steps

Current AOIA Test File

- `tests/test\_aoia\_determinism.py`

Current Validation Focus

- `select\_depth()` determinism
- pressure threshold stability
- invalid pressure rejection
- `load\_config()` deterministic loading

- readonly config behavior
- correlation id shape

docs/reports/PHASE_1A_GIT_VALIDATION.md

Phase 1A Git Validation

Status: validation report

Date: 2026-05-23

Repository: ``/home/l/Desktop/AOIA-Core``

Remote: ``https://github.com/luciferprosun/AOIA-Core.git``

Summary

Phase 1A architecture documents are present in the canonical repository, but the repository is not fully clean.

No runtime source files are modified. No files larger than 50 MB were found. No archives or nested git repositories were found.

Because the repository is not clean under the requested criteria, no new checkpoint commit should be created.

Repository Status

Current branch:

- ``main``

Current HEAD:

- ``5674fd4d25daaf8aa8c0bed1c658f9e0260678e5``

Current git status:

````text`

`## main...origin/main`

`?? docs/forensic-runtime-audit/`

`?? state/`

Modified files: - none

Staged files: - none

Untracked files: - docs/forensic-runtime-audit/CANONICAL\_REFACTOR\_PREP.md - docs/forensic-runtime-audit/CURRENT\_RUNTIME\_FLOW\_MAP.md

- docs/forensic-runtime-audit/MEMORY\_CONTAMINATION\_MAP.md - docs/forensic-runtime-audit/RUNTIME\_BOUNDARY\_VIOLATION.md

- state/model\_config.json - state/providers.json

## Repository Size

Working tree size: - 4.5M

Git directory size: - 2.1M

Repository size is small and does not indicate large artifact contamination.

## Phase 1A Architecture Documents

Expected documents: - docs/architecture/AOIA\_MEMORY\_MODEL.md - docs/architecture/FORBIDDEN\_MEMORY\_FLOWS.md

- docs/architecture/MEMORY\_LAYER\_ACCESS\_MATRIX.md

Validation result: - all expected documents exist in the canonical repository - no runtime files are required for these documents - no provider or routing files are modified

Important note: - These documents are already committed at HEAD 5674fd4d25daaf8aa8c0bed1c658f9e0260678e5. - They were previously pushed to `origin/main`. - This validation report does not rewrite or amend that history.

## Large File Analysis

Files larger than 50 MB: - none found

Recommendation: - no Git LFS action is required for files currently present in the repository - no large file deletion or movement is required

## Archives And Hidden Artifacts

Archives found in repository: - none found for `.zip`, `.tar`, `.tar.gz`, `.tgz`, `.7z`, `.rar`, or `.gz`

Hidden files found outside `.git`: - `.gitignore`

Temporary report-like files inside repository: - `AOIA_CONTAMINATION_REPORT.md` - `runtime/knowledge/validator/validation_re`

Assessment: - both appear to be existing tracked project documents, not new temporary contaminati

**\*\*LSC FRAMEWORK\*\***

**\*\*HOSTILE PHYSICS AUDIT\*\***

**\*Pre-BEST-2 Freeze \ | Independent Scientific Review\***

Generated: 2026-05-25 \ | Version reviewed: LSC 6.3.0 (Zenodo 20037838)

**\*\*AUDIT MANDATE:\*\*** This document provides a hostile but scientifically fair physics audit of the LSC (Lepto-Scalar Coupling) neutrino phenomenology framework. The auditor's role is to identify weak assumptions, hidden inconsistencies, dimensional problems, physically implausible structures, overclaims, undefined variables, unsupported inference jumps, and places where detector effects are confused with neutrino-sector physics. No new LSC theory is invented here.

**\*\*TREATMENT:\*\*** LSC is treated throughout as an **\*\*[unvalidated phenomenological framework]{.underline}\*\***, not established physics.

-----

**\*\*1. EXECUTIVE AUDIT SUMMARY\*\***

The LSC framework, as of version 6.3.0, presents a detector-response tensor ansatz intended to model the Gallium/BEST neutrino anomaly without claiming discovery. The framework has undergone significant self-correction from its PBH-curvature origins (4.2) through to the trace/traceless separation (6.3.0). The internal discipline of the 6.3.0 freeze protocol is genuine and commendable. However, the framework carries several unresolved problems that range from immediately fatal (CRITICAL) to statistically disqualifying (HIGH) to correctible (MEDIUM/LOW).

The key overall diagnosis:

- The framework is not falsified but is also not yet falsifiable in its current form.
- The tensor degree of freedom significantly exceeds the available observational constraints.
- The central physical mechanism ( $\Delta G$ ) has no derivable connection to any known physics at the required scale.
- The Lorentz-violation implications of the  $D_{ij}$  tensor are entirely unaddressed and may constitute immediate experimental exclusion.
- The statistical framework is formally incomplete without full covariance matrices.

| <b>**\#**</b> | <b>**Finding**</b>                                                                   | <b>**Severity**</b> |

# LSC Canonical Theory Context Package - Pre-BEST-2 Freeze

Generated: `2026-05-25 07:28:59`

This document is a source-grounded reconstruction package for the LSC / SC neutrino phenomenology line. It is

## ## Scope Boundary

The canonical scope is LSC neutrino phenomenology: Gallium/BEST, detector response, validation, sterile-neutrino

## ## Executive Reconstruction

- LSC currently stands as an unvalidated phenomenological framework, not a confirmed physical theory.
- The current pre-BEST-2 freeze point is best represented by LSC 6.3.0: trace/traceless detector-response sensitivity
- The historical line moved from PBH/curvature-heavy language (4.2), through relativistic energy reconstruction
- The strongest internal warning is that exact anchor fits are insufficient; leave-one-out and cross-experiments
- The key missing evidence is full covariance/exposure-level public data for BEST/GALLEX/SAGE and orientation

## ## Source Inventory

| Source name                           | URL / DOI                                                                                                                   | Type                                    | Status       | Relevant content | Notes     |

# LLM-MHLM Canonical Archive

This is the canonical archive for model-by-model MHLM work.

## Read First

- `PROJECT\_INDEX.md` for the current map
- `models/README.md` for the folder rules
- `models/iterations/README.md` for dated snapshots
- `models/iterations/2026-05-05/INDEX.md` for the latest cleaned snapshot

## Structure

- `models/<model>/` stores raw working notes and artifacts.
- `models/<model>/incoming/YYYY-MM-DD/` stores imported source material.
- `models/iterations/YYYY-MM-DD/` stores the cleaned, GitHub-facing snapshot.
- `reports/daily/YYYY-MM-DD/` stores day-level synthesis.
- `mhlml/` stores evidence and probability logs.

## Current Snapshot

- `2026-05-05` is the current cleaned snapshot.
- It contains one folder per model in lowercase.
- It uses date-stamped `FINAL\_\*` files for stable linking.

## Rule of Thumb

If a file is for active editing, keep it in the working model folder.  
If a file is for publication-style navigation, keep it in the dated iteration snapshot.

Manus Final Vision For MDLH

Date: 2026-05-05

Manus is the integration and packaging layer. Its role is to merge theory fragments into one coherent preprint-style package.

Manus contributes:

- structural unity;
- packaging and redaction;
- bridge documents between theory stages;
- stronger release-level presentation.

Manus makes the project look publishable, but not independently proven.

Source kind: local\_file  
Model: mixed/unknown

Domain: MHL/MDLH

# OpenRouter Folder

Purpose:

Track outputs produced via OpenRouter (routing/wrapper). Always record the \*underlying model name\* in the file

Use this folder for:

- scripts used to call OpenRouter
- model configuration notes
- outputs that need attribution to a specific model

# AOIA Evolution And Runtime Safety

AOIA material is included as the control-system response to provenance contamination, hidden model lineage, unsafe execution assumptions, and operator-boundary ambiguity observed during recursive AI-assisted work.

## AOIA Evolution Summary

- Deterministic retrieval and bounded execution replace speculative autonomous behavior.
- Runtime safety, memory semantics, approval boundaries and transcript safety are treated as first-class architecture.
- AOIA/AIOA spelling ambiguity is preserved as provenance evidence rather than normalized away.
- Repository separation and authority separation are treated as audit controls.

## Architecture\_Evolution/AOIA\_RUNTIME\_MAP.md

Source kind: local\_file

Model: mixed/unknown

Domain: AOIA

# AOIA Runtime Map

Date: 2026-05-23

Mode: structural extraction audit

## Canonical Runtime Topology

Primary runtime entrypoints:

- `runtime/main.py`: canonical CLI runtime spine
- `runtime/webapp.py`: thin HTTP wrapper around `AgentRuntime`
- `runtime/run.sh`: CLI launcher
- `runtime/run\_web.sh`: web launcher

Primary execution spine:

1. user input
2. `runtime/main.py`
3. local fast route via `runtime/router/local\_router.py`
4. epistemic/local knowledge route via `runtime/adaptive\_routing/epistemic\_kernel.py`
5. secondary local knowledge route via `runtime/orchestrator/knowledge\_router.py`
6. model planning via `runtime/providers/config.py`
7. tool execution via `runtime/tools/executor.py`
8. state persistence via `runtime/tools/memory.py`

## Canonical Runtime Modules

### Runtime control

- `runtime/main.py`
  - owns request loop
  - owns safeguard loading
  - owns local route, knowledge route, planner route, and tool loop
- `runtime/webapp.py`
  - exposes status, chat, and model switching over local HTTP
  - reuses `AgentRuntime`

### ### Routing systems

- `runtime/router/local\_router.py`
  - deterministic fast path for obvious local operations
- `runtime/adaptive\_routing/epistemic\_kernel.py`
  - deterministic local epistemic gate
  - joins retrieval, provenance, contradiction awareness, and confidence labeling
- `runtime/orchestrator/knowledge\_router.py`
  - older RHCSA-first local router
  - overlaps functionally with the epistemic kernel

### ### Retrieval systems

- `runtime/tools/rhcsa\_search.py`
  - deterministic search over RHCSA knowledge artifacts
  - supports keyword, tag, exact, grep, and topic filtering
- `runtime/knowledge/rhcsa\_engine.py`
  - formats retrieval for local operational answers
- `runtime/knowledge/\*\*`
  - RHCSA corpus, indexes, schema, examples, validators, and source artifacts

### ### Provenance and contradiction systems

- `runtime/tools/epistemic\_registry.py`
  - builds provenance and contradiction registries from knowledge artifacts
- `runtime/provenance\_registry.json`
  - persisted provenance snapshot
- `runtime/contradiction\_registry.json`
  - persisted contradiction snapshot

### ### Memory and state systems

- `runtime/tools/memory.py`
  - owns runtime state, JSONL traces, browser logs, and Obsidian vault generation
  - writes state inside the repository tree
- `runtime/tools/memory\_hats.py`
  - scoped instruction overlays

### ## Authority Boundaries

Canonical authority inside this repository:

- runtime execution
- retrieval
- provenance
- contradiction handling
- bounded memory/state handling
- provider abstraction
- local web wrapper
- tests and runtime docs

Non-canonical or unstable surfaces still present:

- orchestration remnants
- adaptive routing experiments beyond the deterministic kernel
- generated-state paths created inside the repo
- historical research notes embedded in runtime paths
- duplicated ADR/documentation trees

## ## Dependency Summary

Core runtime dependency chain:

- `main.py` -> `LocalRouter`
- `main.py` -> `AOIAEpistemicKernel`
- `main.py` -> `KnowledgeRouter`
- `main.py` -> `ProviderManager`
- `main.py` -> `ExecutionEngine`
- `main.py` -> `MemoryStore`

Execution dependency chain:

- `ExecutionEngine` -> filesystem tools
- `ExecutionEngine` -> shell tools
- `ExecutionEngine` -> browser tools
- `ExecutionEngine` -> project scanner
- `ExecutionEngine` -> `MemoryStore`

Epistemic dependency chain:

- `AOIAEpistemicKernel` -> deterministic router
- `AOIAEpistemicKernel` -> epistemic registry
- `AOIAEpistemicKernel` -> RHCSA search

## ## Unstable Zones

1. `runtime/orchestrator/`
  - present in canonical runtime flow
  - partially disabled by command surface
  - still imported and still callable from `main.py`
2. `runtime/adaptive\_routing/`
  - contains canonical kernel plus non-canonical research and environment routing experiments
3. `runtime/tools/memory.py`
  - writes mutable state under repository root
  - mixes runtime code and generated artifacts structurally
4. `runtime/main.py` import boundary
  - imports `memory.rhcsa\_context` and `memory.gemma\_worker\_memory`
  - corresponding package is absent in current `AOIA-Core` extraction
  - this is a transitional break in canonical runtime completeness

## ## Runtime Status Judgment

AOIA-Core currently contains the true runtime center of gravity, but not yet a fully isolated canonical runt

Classification:

- runtime spine: canonical
- runtime isolation: partial
- structural stability: partial

## Architecture\_Evolution/AOIA\_STEP\_1\_REPORT.md

- Bytes: 964

Domain: AOIA

# AOIA Step 1 Report - Repository Constitution

### ## Objective

Create the constitutional documentation needed before continuing AOIA upgrades inside the terminal app.

### ## Implemented

- `docs/REPOSITORY\_CONSTITUTION.md`
- `docs/REPO\_STRUCTURE.md`
- `docs/ARCHITECTURE.md`
- `docs/CONSTRAINTS.md`
- `docs/GLOSSARY.md`
- `docs/CODING\_PHILOSOPHY.md`
- `docs/adr/README.md`
- `docs/adr/0001-keep-aoia-isolated.md`

### ## Not Implemented

- No router logic.
- No provider integration.
- No runtime integration.
- No UI changes.
- No autonomous behavior.
- No new dependencies.

### ## Validation

This is a documentation-only step. Validation is:

- files exist under `docs/`
- ADR system exists under `docs/adr/`
- AOIA remains isolated
- no runtime source files were edited

## Architecture\_Evolution/AOIA\_STEP\_2\_REPORT.md

- Bytes: 979
- SHA-256: 7b2194db3d59959ae59b854bbde5c04f0cd7d52667d4d1ef9d4830dba7a6346a

# Extracted MHLM Evidence: AOIA\_STEP\_2\_REPORT.md

Source: /home/l/Desktop/MHLM\_MDLH/case\_studies/aoia\_runtime\_forensics/AOIA\_STEP\_2\_REPORT.md

Source kind: local\_file

Model: mixed/unknown

Domain: AOIA

# AOIA Step 2 Report - Minimal Deterministic Router Skeleton

## ## Objective

Create the first deterministic router skeleton without networking or runtime integration.

## ## Implemented

- `adaptive\_routing/deterministic\_router.py`  
- `docs/adr/0002-minimal-deterministic-router-skeleton.md`

## ## Router Contract

Function:

```
```python
select_depth(pressure: int) -> str
```

Outputs:

- shallow
- mid
- deep

Thresholds:

- 0..33 -> shallow
- 34..66 -> mid
- 67+ -> deep

Not Implemented

- No network checks.
- No traffic analysis.
- No provider selection.
- No token policy.
- No integration with `main.py`.
- No UI changes.
- No autonomous behavior.

Validation

Validation performed:

- Python compile check.
- Sample output check for 0, 34, and 67.

Architecture_Evolution/AOIA_STEP_3_REPORT.md

- Bytes: 1102
- SHA-256: `d4aa591e2778fdbfa2bb74cb1abc7b4e22df9f6713b6b97bae8e2c991ac8c6ff`

Source kind: local\_file  
Model: mixed/unknown  
Domain: AOIA

## # AOIA Step 3 Report - Configuration Layer

### ## Objective

Create a minimal AOIA configuration layer with immutable, startup-only, validated config and readonly runtime behavior.

### ## Implemented

- 'adaptive\_routing/aoia\_config.json'
- 'adaptive\_routing/config\_loader.py'
- 'docs/adr/0003-immutable-startup-configuration.md'

### ## Configuration Contract

Current config:

- version: '1'
- depths: 'shallow', 'mid', 'deep'
- pressure thresholds:
  - 'shallow\_max = 33'
  - 'mid\_max = 66'
- runtime policy:
  - 'load\_timing = startup\_only'
  - 'mutable\_at\_runtime = false'
  - 'network\_required = false'

### ## Not Implemented

- No runtime integration.
- No live reload.
- No provider integration.
- No network checks.
- No UI controls.
- No mutable runtime policy.

### ## Validation

Validation performed:

- JSON parse check.
- Python compile check.
- 'load\_config()' sample check.
- readonly behavior check.

## Architecture\_Evolution/AOIA\_STEP\_4\_REPORT.md

- Bytes: 903
- SHA-256: 31201230f5d62792275941dc61ff555cb0f73bd61f8775553623692ecd26350b

# Extracted MHLM Evidence: AOIA\_STEP\_4\_REPORT.md

Source kind: local\_file

Model: mixed/unknown

Domain: AOIA

## # AOIA Step 4 Report - Logging Philosophy

## ## Objective

Define AOIA logging as stdout-only, plain text, correlation-id based, and free of dashboards or telemetry.

## ## Implemented

- `adaptive\_routing/stdout\_logger.py`
- `docs/LOGGING\_PHILOSOPHY.md`
- `docs/adr/0004-stdout-only-plain-text-logging.md`

## ## Logging Contract

Format:

```text

ts=<iso8601-utc> cid=<correlation-id> event=<event-name> detail=<short-detail>

Not Implemented

- No dashboard.
- No log database.
- No external telemetry.
- No runtime integration.
- No file logging.
- No provider logging.

Validation

Validation performed:

- Python compile check.
- Sample stdout line check.
- Runtime import check remains clean.

Architecture_Evolution/AOIA_STEP_5_REPORT.md

- Bytes: 1004
- SHA-256: `e8799df276d985ff249eb8d45e239d35d755e8d314c2aaf3e68559a6f14172e2`

Source kind: local\_file

Model: mixed/unknown

Domain: AOIA

# AOIA Step 5 Report - Test Constitution

## ## Objective

Define AOIA testing rules and add deterministic fail-fast tests for the current isolated AOIA modules.

## ## Implemented

- 'tests/test\_aeia\_determinism.py'
- 'docs/TEST\_CONSTITUTION.md'
- 'docs/adr/0005-test-constitution-determinism-first.md'

### ## Test Coverage Added

- same input returns same 'select\_depth()' output
- threshold checks for 'shallow', 'mid', 'deep'
- negative pressure raises 'ValueError'
- config loads deterministically
- config is readonly after loading
- correlation id shape is stable

### ## Not Implemented

- No runtime integration tests.
- No provider tests.
- No network tests.
- No UI tests.
- No dashboard or telemetry tests.

### ## Validation

Validation command:

```
'''bash
python3 -m unittest tests.test_aeia_determinism
```

### ### Runtime\_Safety/AOIA\_RECOVERY\_AUDIT.md

```
AOIA Recovery Audit
```

```
Generated: 2026-05-25 18:09:02
```

### ## Scope

Recovery audit after a full system interruption during master library generation.  
The audit intentionally avoids restarting any heavy single-pass PDF export.

### ## Git State

- 'git status --short --branch' return code: 0

```
'''text
```

```
main...origin/main
```

```
?? AOIA_RECOVERY_AUDIT.md
```

```
?? reports/master_library_recovery/
```

?? scripts/build\_master\_library\_staged.py

- git fsck --no-progress return code: 0

(no output)

## Required Directories

- runtime/: present, 5908 files
- tui/: present, 20 files
- tests/: present, 42 files
- reports/: present, 329 files
- scripts/: present, 2 files

## Interrupted Export Artifacts

- No interrupted AOIA\_Core\_Master\_Library temp/part/pandoc artifacts found in repo root, Desktop, or /tmp.

## Existing PDF Integrity

| Path                                                                                                       | Size   | Pages | pdftinfo |

| reports/forensic_export/forensic_full_snapshot15341                                                        | 264151 | 66    | valid    |
| reports/forensic_export/memory_and_provenance15341                                                         | 787618 | 480   | valid    |
| reports/forensic_export/retrieval_and_knowledge_layer.pdf                                                  | 153760 | 45    | valid    |
| runtime/knowledge/source/RHCSA_Command_Library(1).pdf                                                      | 14661  | 453   | valid    |
| runtime/knowledge/source/linux_master_library14661                                                         |        |       |          |

## Recovery Findings

- Git object database check completed with no reported corruption.
- Required runtime, TUI, test, report, and script directories are present.
- Existing repository PDFs are readable by **pdftinfo**.
- No recursive master export directory or repeated archive generation was found.
- No broken temporary master-library export artifact was found, so no cleanup deletion was performed.

## Cleanup Actions

- Removed files: none.
- Reason: audit found no broken temporary export files matching the interrupted master-library patterns.

Source kind: local_file

Model: mixed/unknown

Domain: AOIA

AOIA Memory Model

Status: canonical doctrine for AOIA-Core v0.1
Phase: 1A - Memory Ontology Freeze
Mode: documentation only

Purpose

AOIA memory is a layered epistemic system, not a single generic store.

Each layer has a distinct authority class, persistence rule, mutability rule, and access boundary. Runtime c

This document freezes the canonical memory doctrine before implementation.

Layer Summary

| Layer | Name | Authority Class |
|-------|-------------------------|----------------------------|
| L0 | Ephemeral Runtime State | continuity only |
| L1 | Operational Logs | procedural audit |
| L2 | Reasoning Traces | inferential audit |
| L3 | Provenance Records | source lineage |
| L4 | Immutable Evidence | factual support artifact |
| L5 | Contradiction Registry | unresolved conflict record |

L0 Ephemeral Runtime State

Purpose:

- Maintain active session continuity.
- Track volatile runtime context such as current task, current working directory, open browser state, recent

Allowed writers:

- Runtime coordinator.
- Execution engine.
- Browser/session adapters.
- Explicit state migration utility in future implementation.

Allowed readers:

- Runtime coordinator.
- Status commands.
- Execution engine.
- Operator-facing diagnostics.

Persistence rules:

- May be persisted for short continuity restoration.
- Must be treated as cache-like runtime state.
- Must not be used as canonical memory authority.

Mutability rules:

- Fully mutable.
- May be overwritten, compacted, rotated, or discarded.
- No append-only requirement.

Retention policy:

- Short retention.
- Session-scoped by default.
- May be cleared without epistemic data loss if higher layers are intact.

Forbidden inputs:

- L2 reasoning traces as state facts.
- L4 evidence bodies copied into state as authority.
- L5 contradiction status collapsed into a simple boolean.
- Cloud planner output stored as trusted state.

Forbidden outputs:

- Direct promotion into L3 provenance.
- Direct promotion into L4 evidence.
- Direct contradiction resolution in L5.
- Source authority decisions.

Contamination risks:

- Temporary state can be mistaken for long-lived truth.
- Recent outputs can bias retrieval or planning if later treated as facts.
- Session state can silently overwrite older context and erase uncertainty.

L1 Operational Logs

Purpose:

- Record what the runtime did.
- Preserve procedural auditability of actions, commands, browser events, approvals, rejections, and tool res

Allowed writers:

- Execution engine.
- Runtime coordinator.
- Browser/session adapters.
- System event logger.

Allowed readers:

- Runtime diagnostics.
- Audit tools.
- Operator review tools.
- Future replay tooling for procedural reconstruction.

Persistence rules:

- Append-only preferred.
- Corrections must be represented by later entries.
- Logs may be rotated or archived.

Mutability rules:

- No silent rewrite after emission.
- Redaction is allowed only as a marked derivative artifact.
- Rotation must preserve chronological replay metadata where practical.

Retention policy:

- Medium retention.
- Retain per session or configured audit period.
- May be archived separately from canonical evidence.

Forbidden inputs:

- L2 reasoning traces copied as operational facts.
- L3 provenance records flattened into generic logs without identity.
- L4 evidence bodies copied into logs as substitutes for evidence.
- L5 contradiction records copied as resolved outcomes.

Forbidden outputs:

- Direct promotion into L4 evidence.
- Direct creation of L3 provenance.

- Direct update of L5 contradiction state.
- Retrieval source material.

Contamination risks:

- A successful command can be mistaken for verified truth.
- Shell output can be mistaken for evidence without source lineage.
- Browser events can be mistaken for captured source artifacts.
- Approval rejection logs can be mistaken for user intent or epistemic evidence.

L2 Reasoning Traces

Purpose:

- Preserve route choice, uncertainty, confidence shaping, fallback rationale, epistemic safeguards, and plan
- Support audit of why AOIA answered, declined, routed locally, routed externally, or emitted unknown.

Allowed writers:

- Epistemic kernel.
- Runtime coordinator.
- Safeguard emitters.
- Future retrieval guard.
- Future planner audit adapter.

Allowed readers:

- Audit tools.
- Runtime diagnostics.
- Confidence and safeguard review paths.
- Human review workflows.

Persistence rules:

- Append-only.
- Event ordered.
- Must remain separate from evidence and provenance stores.

Mutability rules:

- No silent edits.
- Corrections require a new trace event.
- Summaries are derivatives and must not replace raw traces.

Retention policy:

- Long enough for audit and replay.
- May be archived by session.
- Must remain quarantined from retrieval evidence sources.

Forbidden inputs:

- L4 evidence bodies transformed into reasoning-only summaries without preserving source references.
- L5 contradiction records treated as resolved reasoning conclusions.
- Cloud planner output stored as evidence-like trace.

Forbidden outputs:

- Promotion into L4 evidence.
- Promotion into L3 provenance.
- Retrieval corpus input.
- Authority registry input.
- Direct contradiction resolution.

Contamination risks:

- Reasoning may be mistaken for factual evidence.
- Model-generated explanations may be treated as source truth.

- Summaries can drift from the raw trace.
- Retrieval over reasoning traces can create recursive self-confirmation.

L3 Provenance Records

Purpose:

- Preserve source identity, lineage, fingerprints, source metadata, and replay constraints.
- Anchor evidence identity and contradiction source relationships.

Allowed writers:

- Provenance registry builder.
- Source ingestion pipeline.
- Knowledge pack build pipeline.
- Future append-only provenance log.
- Future authority registry with explicit schema.

Allowed readers:

- Retrieval guard.
- Epistemic kernel.
- Evidence store.
- Contradiction registry.
- Audit tools.
- Human review workflows.

Persistence rules:

- Append-only or versioned regeneration.
- Prior source identity must remain reconstructable.
- Every provenance record must include a schema version or equivalent generation context.

Mutability rules:

- No silent mutation of existing source identity.
- Supersession must be represented explicitly.
- Regenerated registries must preserve previous lineage or be marked as a new epoch.

Retention policy:

- Long retention.
- Must survive archive transitions.
- Must remain available for evidence replay and contradiction review.

Forbidden inputs:

- L0 runtime state.
- L1 operatio

Domain: AOIA

AOIA Memory Ontology

Date: 2026-05-23
Phase: Memory Ontology Foundation

Doctrine

Memory is not one store.
It is a layered epistemic system with different authority, mutability, and replay rules.

AOIA foundational layers:

- L0 Ephemeral Runtime State
- L1 Operational Logs
- L2 Reasoning Traces
- L3 Provenance Records
- L4 Evidence Store
- L5 Contradiction Records

L0 - Ephemeral Runtime State

Purpose:

- support active runtime continuity during a session

Authority level:

- lowest epistemic authority

Mutability rules:

- fully mutable
- replaceable
- expected to drift during execution

Retention policy:

- short-lived
- may be rotated or overwritten

Access policy:

- runtime internal
- status inspection allowed

Contamination risks:

- if promoted into evidence, transient state becomes false memory

Replay requirements:

- replay not required for strict epistemic history
- useful only for short continuity restoration

L1 - Operational Logs

Purpose:

- record what the runtime did

Authority level:

- procedural authority, not truth authority

Mutability rules:

- append-only preferred
- correction by later append, not silent rewrite

Retention policy:

- medium retention

- may be archived by session or by period

Access policy:

- operator-readable
- audit-usable

Contamination risks:

- command traces can be mistaken for verified evidence
- execution success can be mistaken for factual truth

Replay requirements:

- must support chronological replay of actions

L2 - Reasoning Traces

Purpose:

- preserve epistemic rationale, uncertainty, route choice, and review triggers

Authority level:

- inferential authority, below evidence and provenance

Mutability rules:

- append-only
- never silently edited in place after emission

Retention policy:

- retain for audit and debugging
- may be sampled for summaries, but raw trace should remain replayable

Access policy:

- restricted runtime/audit use
- not to be treated as truth source

Contamination risks:

- reasoning can be mistaken for evidence
- summaries can drift away from exact reasoning state

Replay requirements:

- replayable by session and event order

L3 - Provenance Records

Purpose:

- identify source origin, artifact identity, references, and fingerprints

Authority level:

- structural truth about source lineage

Mutability rules:

- append-only or versioned regeneration
- no silent mutation of prior source identity

Retention policy:

- long retention
- must survive retrieval and archive transitions

Access policy:

- runtime readable

- audit readable

Contamination risks:

- stale registries can misrepresent current source state
- generated records can be mistaken for source content itself

Replay requirements:

- deterministic regeneration compatibility required

L4 - Evidence Store

Purpose:

- preserve factual support objects used in local answer formation or external inspection

Authority level:

- higher than logs and reasoning, below provenance-backed source identity if evidence is derived

Mutability rules:

- immutable once captured
- corrections require new evidence object, not overwrite

Retention policy:

- long retention when referenced in reasoning or outcomes

Access policy:

- runtime and audit use
- careful exposure in user-visible summaries

Contamination risks:

- logs or summaries may be promoted as evidence without validation
- browser snapshots may include noisy or partial captures

Replay requirements:

- evidence object must retain fingerprint, capture time, and source linkage

L5 - Contradiction Records

Purpose:

- preserve unresolved epistemic conflicts as signals

Authority level:

- meta-epistemic authority

Mutability rules:

- append-only conflict history
- resolution creates a new state entry, not erasure

Retention policy:

- long retention
- contradictions must remain visible even after later interpretation

Access policy:

- runtime readable
- audit critical

Contamination risks:

- contradictions may be incorrectly treated as errors to delete
- automated resolution may erase epistemic pressure

Replay requirements:

- contradiction emergence and later status changes must be replayable

Ordering Principle

Recommended trust ordering:

- source provenance and fingerprinting constrain evidence identity
- evidence constrains reasoning
- reasoning constrains output
- contradictions constrain confidence
- operational logs never outrank evidence
- ephemeral state never outranks any persisted epistemic layer

Core Rule

L1 is not L4.

L2 is not L4.

L5 is not failure.

AOIA TUI Phase 2 Report

Generated: 2026-05-25

1. New Operator Console Features

TUI Phase 2 adds a controlled operator console around the existing runtime.

The implementation remains a compatibility wrapper and does not replace routing, provider management, retrieval, provenance, or executor semantics.

New elements:

- `tui/widgets/transcript\_panel.py` for bounded operator-visible transcript output.
- `tui/widgets/approval\_panel.py` for visible risky-action approval state.
- `tui/widgets/status\_bar.py` for persistent compact runtime status.
- Updated `tui/app.py` operator input dispatch.
- Updated `tui/views/dashboard.py` layout.
- `scripts/start\_tui.sh` startup wrapper.
- `tests/test\_tui\_phase2.py` coverage.

2. Runtime Compatibility Verification

Operator input is routed through:

```
```text
```

```
AOIATerminalApp -> AgentRuntime.run_text_request()
```

Provider switching uses the existing:

```
ProviderManager.switch_model()
```

No new provider adapter, router, websocket, FastAPI layer, agent framework, embedding system, vector database, or autonomous loop was introduced.

### 3. Transcript Safety Verification

The transcript panel is bounded and sanitizes runtime-internal markers. It intentionally excludes:

- system prompts
- runtime state JSON
- planner request JSON
- raw provider output markers
- prompt previews
- reasoning trace markers
- chain-of-thought style internals

Displayed content is limited to operator-visible runtime transcript, approved execution summaries, and safe operational output.

### 4. Approval-Boundary Verification

The TUI wraps the existing executor approval path by replacing the executor instance approval callback inside the TUI instance only.

Risky actions still flow through:

```
ExecutionEngine.execute() -> _request_approval()
```

TUI approval behavior:

- **Ctrl+A** approves pending risky action.
- **Ctrl+X** rejects pending risky action.
- pending approval state is visible in **ApprovalPanel**.
- timeout defaults to safe rejection after 120 seconds.
- safe actions continue through existing runtime behavior.

This does not weaken shell classification or executor validation.

### 5. Test Results

Commands run:

```
PYTHONPATH=runtime:. runtime/.venv/bin/python -m compileall -q runtime tui tests
bash -n scripts/start_tui.sh
PYTHONPATH=runtime:. runtime/.venv/bin/python -m unittest tests.test_tui_phase1 tests.test_tui_phase2 -v
PYTHONPATH=runtime:. runtime/.venv/bin/python -m unittest discover -s tests -v
```

Results:

Check	Result
Compile check	PASS
Startup script syntax	PASS
TUI Phase 1 + 2 tests	11 / 11 PASS
Full unittest suite	123 / 123 PASS

### 6. Startup Instructions

Start the TUI with:

```
cd /home/l/Desktop/AOIA-Core
./scripts/start_tui.sh
```

Controls:

Control	Behavior
Enter request	Runs through <code>AgentRuntime.run_text_request()</code>
<code>/model</code>	Lists configured model presets
<code>/model NAME</code>	Switches provider/model through existing provider manager
<code>/status</code>	Prints runtime status into transcript
<code>/clear</code>	Clears visible transcript
<code>Ctrl+A</code>	Approves pending risky action
<code>Ctrl+X</code>	Rejects pending risky action
<code>Ctrl+P</code> / <code>Ctrl+N</code>	Command history navigation
<code>Ctrl+R</code>	Refresh runtime status
<code>Ctrl+C</code> or <code>q</code>	Exit

## 7. Remaining Blockers

- TUI startup was validated by import and script syntax, not by a long-lived manual terminal session in this report.
- Approval timeout is implemented as a fixed 120-second guard and is not yet user-configurable.
- The TUI transcript is intentionally minimal; it does not yet include rich filtering controls or export controls.
- Runtime remains uncommitted with prior environment fixes and Phase 1 changes.

## 8. Prototype Readiness Update

AOIA now has a working terminal prototype surface:

- status dashboard
- live replay-safe operational log panel
- operator input
- slash command support
- provider switching
- bounded transcript view
- approval visibility
- safe shutdown event logging
- startup wrapper

This is still a controlled prototype, not an autonomous agent system.

## 9. Recommended Next Milestone

Recommended next milestone:

TUI Phase 3 - Operator Session Controls and Export

Scope should remain narrow:

- transcript export
- session replay selection
- current log file selector
- clearer approval timeout display
- manual provider health refresh
- no runtime router rewrite
- no hidden reasoning exposure
- no autonomous orchestration expansion

AOIA Core Master Library

This master library was generated after recovery from a full system interruption. It uses staged markdown se

Export Strategy

1. Generate recovery audit markdown.
2. Generate architecture markdown.
3. Generate runtime/code markdown.
4. Generate tests/reports markdown.
5. Generate repository tree/index markdown.
6. Assemble markdown checkpoints.
7. Export final PDF with Pandoc and 'lualatex'.

\newpage

<!-- section: 00_recovery_audit.md -->

AOIA Recovery Audit

Generated: 2026-05-25 18:09:02

Scope

Recovery audit after a full system interruption during master library generation.
The audit intentionally avoids restarting any heavy single-pass PDF export.

Git State

- 'git status --short --branch' return code: 0

'''text
main...origin/main
?? AOIA_RECOVERY_AUDIT.md
?? reports/master_library_recovery/
?? scripts/build_master_library_staged.py
 • git fsck --no-progress return code: 0

```

(no output)

Required Directories

- runtime/: present, 5908 files
- tui/: present, 20 files
- tests/: present, 42 files
- reports/: present, 329 files
- scripts/: present, 2 files

Interrupted Export Artifacts

- No interrupted AOIA\_Core\_Master\_Library temp/part/pandoc artifacts found in repo root, Desktop, or /tmp.

Existing PDF Integrity

Path	Size	Pages	pdfinfo
MHLM_MHSR/case_studies/anti_hallucination_exp_app/archive/AOIA_MASTER_LIBRARY/AOIA_Master_Library.pdf	372701	127	valid
docs/reports/AOIA_RESTART_PRODUCTION_REPORTL34837	34837	7	valid
reports/forensic_export/architecture_and_runtime.pdf	305586	71	valid
reports/forensic_export/forensic_full_snapshot.pdf	153411	13	valid
reports/forensic_export/memory_and_provenance.pdf	264151	66	valid
reports/forensic_export/retrieval_and_knowledge_slayer.pdf	7187618	480	valid
runtime/knowledge/source/RHCSA_Command_Library(1).pdf	153760	45	valid
runtime/knowledge/source/linux_master_library14601.pdf	14601	453	valid

Recovery Findings

- Git object database check completed with no reported corruption.
- Required runtime, TUI, test, report, and script directories are present.
- Existing repository PDFs are readable by pdfinfo.
- No recursive master export directory or repeated archive generation was found.
- No broken temporary master-library export artifact was found, so no cleanup deletion was performed.

Cleanup Actions

- Removed files: none.
- Reason: audit found no broken temporary export files matching the interrupted master-library patterns.

# Architecture Section

## Architecture Overview

AOIA Core is organized around deterministic local execution, explicit runtime boundaries, provenance-preserving retrieval, and operator-controlled actions. The recovered snapshot preserves the existing design intent: no autonomous expansion, no runtime learning side effects, bounded execution, and explicit approval semantics for risky operations.

## Subsystem Map

- `runtime/main.py`: runtime entrypoint, routing, command handling, provider manager integration, browser/local tool bridge, and approval flow.
- `runtime/providers/`: provider abstraction and concrete provider configuration for local/offline and compatible model paths.
- `runtime/retrieval/`: retrieval facade, feature flags, Linux retrieval engine, query normalization, scoring, and provenance attachment.
- `runtime/knowledge/`: canonical RHCSA/Linux knowledge assets, extracted source material, indexes, validators, reports, and candidate review queues.
- `runtime/memory/`: evidence memory, reasoning trace, RHCSA context, and memory hat definitions.
- `runtime/tools/`: executor, memory, filesystem, browser, scanner, registry, and validation helpers.
- `tui/`: Textual operator interface, status panels, bounded transcript rendering, approval panel, and runtime dashboard.
- `tests/`: deterministic routing, provider switching, approval, transcript safety, retrieval, provenance, and TUI compatibility tests.
- `docs/` and `runtime/reports/`: architecture, constitution, migration, forensic, and phase reports.

## Governing Principles

- Runtime stability over speculative capability growth.
- Deterministic retrieval and explicit refusal on unresolved local evidence.
- Provenance metadata must stay attached to retrieved evidence.
- Operator approval gates shell/install actions and prevents silent execution.
- Transcript UI must filter internal prompt/reasoning material and stay bounded.
- Memory writes are separated from retrieval so lookup does not create evidence side effects.

## README.md

““markdown # flAmeBorbLLC AIOA LiGaLu

Open-source local terminal AI runtime with AOIA routing foundations and a deterministic RHCSA knowledge pipeline. This repository publishes the functional project code and architecture work without private API secrets, browser state, local session memory, or machine- specific runtime artifacts.

## AOIA

AOIA stands for Adaptive Oceanic Intelligence Architecture.

In this repository, AOIA is used narrowly:

- deterministic routing
- local-first execution
- token and energy conservation
- biologically inspired scheduling research

It is not an AGI system, autonomous swarm, or self-modifying runtime.

## Runtime architecture

USER

- > Local router first
- > Aureon provider

- > Gemini provider when selected
- > fallback API providers
- > JSON action
- > executor
- > shell / filesystem / browser tools
- > result
- > next action or final response

The runtime can: - execute shell commands - create and edit files - keep lightweight agent state - launch and reuse a persistent Playwright browser session - inspect live webpages - capture screenshots - switch models from inside the app with /model

## AOIA and DVM references

The repository contains the current AOIA foundation work:

- adaptive\_routing/
- docs/
- docs/AOIA\_PLANETARY\_INTRO.md
- docs/reference/diel\_vertical\_migration\_wikipedia\_2026-05-22.html
- apps/

The biological inspiration comes from diel vertical migration and related ocean-layer behavior. That inspiration is used only for routing concepts, scheduling concepts, and environmental pressure modeling.

## Application catalog

The repository also contains sibling application directories under `apps/`.

Current imported subproject:

- apps/flameborn-academy-codex-sparrow/
  - flAmeBornLLC / LLM Academy
  - package identifier: `codexprosparrow`

---

```

> **Scope:** This is a forensic systems audit - not marketing analysis.
> Evaluated domains: epistemic stability, provenance architecture, memory semantics,
> contradiction handling, bounded cognition infrastructure, runtime governance, contamination resistance.

```

---

## 1. Major Strengths

Assessed as genuine strengths - not aspirationally correct, but directly addressing documented failure modes comparable systems. Each strength is real only insofar as it is enforced without exception.

---

‘DOMAIN SEPARATION‘

**\*\*Physical separation of LSC-Research, MHLMDLH, and AOIA-Core\*\***

The most consequential structural decision in Wave 2. Mixing scientific authority with AI safety framing with infrastructure governance in a single repository is how projects generate artifacts that contaminate all three domains simultaneously. Physical separation forces explicit boundary crossings that can be governed, audited and - critically - refused. This decision should be treated as **\*\*permanent\*\***, not as a phase of development will eventually converge.

---

‘CONTRADICTIONS AS FIRST-CLASS SIGNALS‘

**\*\*L5 Contradiction Registry as a top-layer epistemic structure\*\***

Treating contradictions as information rather than errors to be resolved is epistemically correct and architectural intent. Most systems resolve contradictions automatically, which destroys the signal that something is contested. Placing the contradiction registry at L5 - the highest layer of the memory ontology - signals architectural intent to preserve rather than suppress epistemic tension. This intent must be protected against

future pressure to "clean up" the registry by auto-resolving entries.

---

‘LAYERED MEMORY ONTOLOGY (L0-L5)’

**\*\*Formal separation of ephemeral state from immutable evidence\*\***

The L0-L5 model is the correct conceptual framework. Separating ephemeral runtime state from operational log from reasoning traces from provenance records from immutable evidence from the contradiction registry prevents the most common contamination pathway: runtime state being treated as evidence. **\*\*The framework exists. The implementation risk is whether the boundaries are enforced in code or only in documentation.\*\***

---

‘RECOGNITION OF CONSENSUS TRUTH’

**\*\*Multi-model convergence identified as an active risk, not a validation mechanism\*\***

Explicitly naming consensus as a contamination risk rather than a quality signal is architecturally mature. Systems treat model agreement as ground truth. AOIA’s recognition that models trained on overlapping data converge on shared errors - not shared truths - is a prerequisite for building a system that can resist the "genie" failure mode. This insight must be operationalized in the retrieval and provenance layers, not left as a design principle.

---

‘APPEND-ONLY LINEAGE GOAL’

**\*\*Provenance-first cognition with replay capability target\*\***

The stated goal of append-only lineage with replay capability is correct. If fully implemented, it would make the system’s reasoning history auditable, contamination detectable, and failure states recoverable. The gap between "stated goal" and "enforced implementation" is the primary risk associated with this strength.

---

‘LEGACY MIXED ROOT ARCHIVAL’

**\*\*Old mixed repository archived rather than migrated incrementally\*\***

Archiving the mixed root rather than incrementally refactoring it is a governance discipline decision. Incremental refactoring of a mixed codebase typically results in permanent partial migration - the old patterns survive the new structure. Clean archival forces a deliberate rebuild of each boundary. This is operationally harder and architecturally safer.

---

## 2. Critical Weaknesses

Every weakness below is structurally embedded in the current architecture and will cause a specific class of failure if left unaddressed.

---

‘MEMORY.PY CONTAMINATION’ CRITICAL

**\*\*Persistence / logging / evidence / runtime state mixed in a single module\*\***

This is the most dangerous implementation detail in the current architecture. The L0-L5 ontology exists as a design document. If ‘memory.py’ implements multiple layers in the same class hierarchy, with shared mutable state, the ontology is **\*\*decorative\*\***. A runtime log entry can become an evidence record through a single misrouted write. A debugging trace can be promoted to provenance by a naming collision.

The module must be refactored into physically separate modules with no shared mutable state **before** the ontology provides any actual safety value.

---

‘VAULT DUALITY‘ CRITICAL

**Machine logs and human notes occupy the same persistence structure**

Two distinct contamination risks:

- A machine log entry is accidentally retrieved as human-authored evidence.
- A human note is treated as an operational log by an automated process.

In a system whose provenance model is the primary safety mechanism, conflating machine-generated and human-authored artifacts is a foundational error. The vault must be structurally bifurcated - not namespaced tagged, but **physically separate** storage with separate access paths and separate provenance chains.

---

‘KNOWLEDGEROUTER AS LEGACY‘ HIGH

**Secondary routing layer identified as "likely transitional/legacy"**

A routing layer described as "likely transitional" is a routing layer that will remain in production **indefinitely**. The word "transitional" in architecture documentation is almost always a pre

# AOIA Long-Term Stability Analysis

## Epistemic Control & System Stability Architecture

---

## Executive Summary

AOIA's survival depends not on maximizing intelligence, but on minimizing epistemic entropy. The architecture

---

## 1. Architectural Principles That Must NEVER Be Violated

### 1.1 The Non-Negotiables

**Principle of External Grounding (PEG)**

No derived conclusion may ever become evidence for another derivation. The evidence layer and reasoning layer

**Principle of Bounded Recursion (PBR)**

Every recursive reasoning loop must have a hard, non-overrideable termination condition based on resource consumption

**Principle of Operator Sovereignty (POS)**

There must exist system states that are permanently unreachable without operator cryptographic authorization

#### **\*\*Principle of Audit Completeness (PAC)\*\***

Every state transition must be reconstructible from logs without reference to the system's internal memory.

#### **\*\*Principle of Adversarial Preservation (PAP)\*\***

Contradictions must be preserved, not resolved, and must remain accessible to future operators and external

### **### 1.2 Why These Are Immutable**

These principles are not features. They are load-bearing walls. Removing any one causes cascading failure:

- Without PEG: Memory becomes poisoned with derived conclusions, creating recursive drift.
- Without PBR: Reasoning depth becomes unbounded, enabling infinite regress and hallucination incubation.
- Without POS: The system can autonomously redefine its own safety boundaries.
- Without PAC: Post-hoc analysis becomes impossible; failures become mysteries.
- Without PAP: The system converges on false consensus by erasing dissent.

---

## **## 2. Anti-Entropy Mechanisms**

### **### 2.1 Entropy Sources in AOIA**

Entropy enters the system through:

- **\*\*Input contamination\*\***: Corrupted or biased source material
- **\*\*Processing noise\*\***: Hallucinations, approximations, compression artifacts
- **\*\*Memory decay\*\***: Gradual degradation of stored propositions through repeated access and re-encoding
- **\*\*Consensus heat\*\***: Energy wasted in maintaining coherent but wrong collective states
- **\*\*Interface friction\*\***: Loss of nuance and uncertainty signals between agent boundaries

### **### 2.2 Required Anti-Entropy Systems**

#### **\*\*Cryogenic Memory (Cold Storage)\*\***

Implement a write-rarely, read-only evidence archive. Once data enters cold storage, it is cryptographically

#### **\*\*Epistemic Heat Sinks (EHS)\*\***

Designated "waste" agents whose sole function is to absorb and isolate contradictions, anomalies, and low-co

#### **\*\*Periodic Amnesia Events\*\***

Scheduled purges of all working memory and derived conclusions. Agents must re-derive from cold storage evid

#### **\*\*Adversarial Entropy Injection\*\***

Mandatory red-team challenges where operators or external systems inject false propositions to test system r

#### **\*\*Provenance Refresh Protocols\*\***

Every N cycles, the system must re-verify the provenance chain of all active hypotheses. Not the content-the

#### **\*\*Compression Budgets\*\***

Strict limits on how much evidence can be summarized or embedded before being passed between agents. Every c

---

## **## 3. Bounded Cognition Architecture**

### **### 3.1 The Problem of Unbounded Reasoning**

Intelligence without bounds is not an asset; it is a liability. Unbounded cognition leads to:

- Overfitting to internal models

- Generating increasingly elaborate justifications for initial errors
- Consuming infinite resources on finite questions
- Developing internal ontologies disconnected from external reality

### ### 3.2 Bounding Mechanisms

#### **\*\*Resource-Anchored Termination\*\***

Every cognitive task receives a budget: tokens, time, memory allocations, and recursion depth. The task term

#### **\*\*Cognitive Horizon Limits\*\***

Agents may only reason N steps from primary evidence. Step N+1 requires explicit operator authorization. Thi

#### **\*\*Confidence Ceiling Protocols\*\***

Implement artificial confidence caps. No agent may express confidence above a threshold (e.g., 85%) for any

#### **\*\*Parallel Bounded Reasoning\*\***

Instead of one agent reasoning deeply, deploy multiple agents reasoning shallowly from different evidence su

#### **\*\*Cognitive Circuit Breakers\*\***

Automatic halts triggered by:

- Self-referential loops in reasoning chains
- Exponential growth in working memory
- Detection of ontological drift (concepts shift

## Provenance Analysis

This section preserves the recovery provenance model: manifest rows, duplicate rows, public metadata snapshots, source-kind tags, hashes and exact local paths. The recovered workflow avoided duplicate archive creation and did not re-expand archives.

# Appendices

## Recursive Consensus And Epistemic Controls

The appendices preserve the audit framing needed to keep recursive AI collaboration transparent: claim boundaries, response lineage, source hashes, duplicate reports, missing-data blockers, repository status, and archival readiness.

### Key Controls

- Preserve model responses as responses, not as empirical evidence.
- Keep source paths, hashes and extraction manifest rows visible.
- Record duplicates instead of silently deleting the historical trace.
- Use staged exports for large libraries to avoid one giant in-memory conversion.
- Preserve incomplete or interrupted artifacts in the recovery audit instead of hiding them.

### MHLM\_RECOVERY\_AUDIT.md

- Bytes: 30933
- SHA-256: d831de5b36cf9306653ae690c56b77e827a16e1fa9072a29b88732d28cef1c62

# MHLM Recovery Audit

This audit was generated before the controlled staged export. It records the resumed state and avoids re-ext

#### ## Recovery Summary

Field	Value
Generated	2026-05-25 21:23:12 +0200
Archive root	/home/l/Desktop/MHLM_Ultra_Master_25maj
Archive root exists	True
INDEX.md	True / 171798 bytes
Extraction manifest rows	874
Duplicate rows	6929
Text-like files currently indexed	2309
Top-level extraction dirs	18
Previous staged LSC sections	8
Relevant PDFs found	105
Relevant markdown files found	1271
Relevant archives found	28
Pandoc/temp suspects found	1
Oversized files >300 MB in extraction tree	0

#### ## Interrupted Export Artifacts

Path	Exists	Bytes	Modified
/home/l/Desktop/MHLM_Ultra_Master_Library.md	True	387	2026-05-25 20:56:32
/home/l/Desktop/MHLM_Ultra_Master_Library.html	True	11816291	2026-05-25 20:56:32
/home/l/Desktop/MHLM_Ultra_Master_Library.pdf	True	1674960	2026-05-25 21:22:31
/home/l/Desktop/MHLM_ULTRA_MASTER_REPORT.md	True	390	2026-05-25 20:56:32
/home/l/Desktop/MHLM_ULTRA_MASTER_REPORT.html	True	6667	2026-05-25 20:56:32
/home/l/Desktop/~lock.MHLM_Ultra_Master_Library.pdf#	True	59	2026-05-25 20:58:01

Interpretation: the 387-byte top-level `MHLM\_Ultra\_Master\_Library.md` is an interrupted placeholder. The 11.

Extracted MHLM Evidence: EPISTEMIC_RISK_REPORT.md

Source: /home/l/Desktop/gpt/faza 2/EPISTEMIC_RISK_REPORT.md
Source kind: local_file
Model: Gemini
Domain: AOIA

Epistemic Risk Report

Executive Risk Statement

AOIA's main epistemic strength is local deterministic retrieval before model use.

AOIA's main epistemic weakness is that once local routing fails, the system drops into a cloud LLM planner 1

This creates a hybrid architecture:

- deterministic local evidence path
- non-deterministic cloud planning path

That hybrid is workable, but it should not be misdescribed as fully deterministic.

Primary Risks

Risk 1: Deterministic branding exceeds actual runtime determinism

Severity:

- High

Observed pattern:

- 'tools/rhcsa_search.py' is deterministic
- 'adaptive_routing/epistemic_kernel.py' is deterministic
- 'main.py' falls through to 'ProviderManager.generate()' when local resolution fails

Why this matters:

- users may trust the system as if all outputs are reproducible
- only the local path is reproducible

Failure mode:

- same prompt, different backend state or provider response, different plan

Risk 2: Hidden cloud dependency contradicts strict local-first expectations

Severity:

- High

Observed pattern:

- providers are OpenRouter, Gemini, DeepSeek, optional Aureon
- 'prompts/system_prompt.txt' explicitly says cloud-model connectivity

Why this matters:

- local-first is true only for routing preference, not for all reasoning

- cloud outage or key loss changes system behavior fundamentally

Failure mode:

- local route miss becomes total failure when cloud providers are unavailable

Risk 3: Evidence channel contamination

Severity:

- Medium

Observed pattern:

- 'tools/executor.py' writes all 'action_result' payloads into evidence memory
- 'main.py' also writes AOIA kernel evidence there

Why this matters:

- execution traces and evidentiary traces are not cleanly separated
- later forensic reading may over-trust operational logs as epistemic evidence

Failure mode:

- evidence store becomes a mixed operational ledger rather than a strict evidence ledger

Risk 4: Registry freshness is assumed, not proven

Severity:

- Medium

Observed pattern:

- 'adaptive_routing/epistemic_kernel.py' loads 'provenance_registry.json' and 'contradiction_registry.json'
- rebuild occurs only if file read fails

Why this matters:

- registries can become stale while appearing valid

Failure mode:

- evidence is attached with outdated provenance or contradiction metadata

Risk 5: Manual review is advisory, not enforced

Severity:

- Medium

Observed pattern:

- manual review appears as output flags
- no hard review workflow exists

Why this matters:

- contradictions are surfaced, but not quarantined
- the system still answers even when review is required

Failure mode:

- operator overlooks review label and treats answer as cleared

Risk 6: Memory-layer ambiguity

Severity:

- Medium

Observed pattern:

- active runtime vault is 'obsidian_vault/'
- user-facing imported memory layer is 'AI_MEMORY_VAULT/'

Why this matters:

- operators may update the wrong vault
- future developers may wire new logic to the wrong persistence layer

Failure mode:

- "persistent memory" expectations diverge from actual runtime behavior

Risk 7: Recursive prompt-state loop

Severity:

- Medium

Observed pattern:

- prior outputs, RHCSA context, hats, and runtime state re-enter prompt generation
- planner loop and reactive loop are both bounded, but still recursive

Why this matters:

- bounded recursion still accumulates context bias
- subtle drift can emerge from repeated self-conditioning

Failure mode:

- model plans increasingly reflect previous model outputs rather than source evidence

Risk 8: Fake autonomy perception

Severity:

- Low to Medium

Observed pattern:

- repo contains orchestrator and worker abstractions
- active worker path is disabled
- docs and structure imply richer autonomy than active runtime executes

Why this matters:

- architectural misunderstanding can lead to unsafe future extensions

Failure mode:

- dormant experimental modules are mistaken for production-ready agent logic

Risk Matrix

Risk	Severity	Actuality
Pseudo-deterministic system framing	High	Present now
Cloud dependency under local-first narrative	High	Present now
Evidence contamination	Medium	Present now
Registry staleness	Medium	Present now
Advisory-only manual review	Medium	Present now
Dual memory-layer ambiguity	Medium	Present now
Recursive prompt-state loops	Medium	Present now
Fake autonomy perception	Low/Medium	Present now

What Is Truly Epistemically Strong

- retrieval is rule-based and local
- provenance metadata exists
- contradiction reporting exists
- 'I DO NOT KNOW' fallback exists
- operator approval boundary blocks tool execution autonomy

What Only Looks Stronger Than It Is

- "deterministic" as a whole-system label
- "contradiction registry" as if it detects truth-level contradictions
- "Obsidian memory layer" as if the imported vault is the active runtime vault
- "orchestrator architecture" as if it is production active

Safe Interpretation

Correct interpretation of the current system:

- deterministic evidence lookup layer
- bounded supervised tool runtime
- cloud-assisted planning fallback
- partial epistemic separation

Incorrect interpretation:

- fully deterministic autonomous epistemic kernel
- cloud-free reasoning engine
- fully clean evidence/reasoning separation
- active autonomous multi-agent architecture

Recommended Phase-2 Judgment

AOIA is epistemically improved relative to a plain tool-using LLM runtime, but it is not yet epistemically s

Most honest label:

- 'deterministic local retrieval with epistemic safeguards, plus non-deterministic cloud planning fallback'

Domain: AOIA

Contamination Map

Date: 2026-05-23

Mode: Forensic analysis only

Risk Model

- 'HIGH RISK contamination': canonical authority is unclear or conflicting; direct separation without operat
- 'MODERATE contamination': domain is mostly clear but boundary leakage exists in metadata, docs, public lin
- 'SAFE shared lineage': cross-reference is historically important and can be preserved as archive/reference

High Risk Contamination

1. Mixed Root READMEs

Files:

- `/home/l/Desktop/WORKFLOW NOWE/README.md`
- `/home/l/github-audit/LLM-MHLM-Main-Project/README.md`
- `/home/l/github-audit/LSC-6.0/README.md`

Why high risk:

- Each root document claims or implies more than one authority domain.
- Physics claims, MHLM framing, public portal references, and audit/AI safety language are combined in singl
- These files are likely to become false authorities if moved unchanged into a single target repo.

Containment status:

- Do not move as canonical root docs.
- Preserve as archival bridge documents with successor references later.

2. Historical Migration Scripts Used as Live Tree Material

Files:

- `/home/l/Desktop/WORKFLOW NOWE/scripts/migration\_commands.sh`
- `/home/l/github-audit/LLM-MHLM-Main-Project/scripts/migration\_commands.sh`

Why high risk:

- They reconstruct mixed history by importing multiple roots into one tree.
- They are not domain code. They are forensic lineage evidence.
- Treating them as executable project instructions inside a canonical target repo would re-contaminate bound

Containment status:

- Preserve as lineage artifacts.
- Keep outside canonical runtime/science roots or within archival subtrees only.

3. Physics Continuity Documents that Explain MHLM Coupling

Files:

- `/home/l/Desktop/WORKFLOW NOWE/LSC/reproducibility/continuity/DATA\_MANIFEST\_2026-05-05.md`
- `/home/l/Desktop/WORKFLOW NOWE/LSC/reproducibility/continuity/SELECTION\_REPORT\_2026-04-30.md`

Why high risk:

- They belong to LSC continuity but explicitly explain selection logic relative to MHLM and broader monorepo.
- Deleting or flattening them would erase provenance.
- Moving them blindly into either LSC or MHLM would distort authority.

Containment status:

- Preserve as bridge documents.
- Keep citation chain intact.

4. Public/AI Bot Tooling Inside Science Roots

Directories:

- `/home/l/Desktop/WORKFLOW NOWE/shared/discord-server-bot-owl/\*\*`
- `/home/l/github-audit/LSC-6.0/tools/discord-research-bot/\*\*`

Why high risk:

- They introduce AI/API-assisted public interaction logic inside roots that otherwise present as scientific.
- They depend on OpenAI/OpenRouter configuration and public Discord operation.
- They are neither LSC canon nor AOIA kernel.

Containment status:

- Manual review required.
- Likely destination is `Akasha Chronicles` or an auxiliary public-ops archive, not LSC.

Moderate Contamination

1. LSC Metadata Linking Public Portal and Epistemic Audit

Files:

- `/home/l/github-audit/LSC-6.0/.zenodo.json`
- `/home/l/Desktop/WORKFLOW NOWE/CITATION.cff`
- selected release README and source notes under `/home/l/github-audit/LSC-6.0/releases/\*\*`

Why moderate:

- Physics authority remains primary.
- Metadata includes public gateway and broader audit references.
- This is manageable if preserved as metadata lineage rather than treated as doctrinal science content.

2. MHLM Assets Using LSC as Case Material

Directories:

- `/home/l/Desktop/WORKFLOW NOWE/MHLM/MDLH-v1.0/paper/\*\*`
- `/home/l/Desktop/WORKFLOW NOWE/MHLM/MDLH-v1.0/prompt-archive/\*\*`
- `/home/l/Desktop/WORKFLOW NOWE/MHLM/MDLH-v1.0/llm-simulation-lab/\*\*`

Why moderate:

- They are clearly MHLM authority, but reference LSC heavily.
- The references are legitimate because LSC is the object of analysis, not because the authority is shared.

Containment status:

- Move as MHLM authority.
- Preserve citations back to LSC artifacts.

3. Research Workspace Boundary Ambiguity

Directory:

- `/home/l/research\_workspace/\*\*`

Why moderate:

- Mostly physics compute infra.
- README includes AI-assisted workflow and cloud portability language.
- No direct AOIA or MHLM control logic was confirmed, but boundary policy is not explicit.

Containment status:

- Operator review required before assigning canon.

4. AOIA Source and Generated State Co-location

Directory:

- `/home/l/Desktop/app2terminl\_opened/\*\*`

Moderate zones:

- `AI\_MEMORY\_VAULT/\*\*`
- `checkpoints/\*\*`
- `exports/\*\*`
- `memory/\*\*`
- `logs/\*\*`
- `obsidian\_vault/\*\*`
- `state/\*\*`
- duplicate documentation in root and `docs/`

Why moderate:

- This is not cross-domain contamination with physics.
- It is contamination between canonical source and generated/runtime state.
- It increases maintenance risk and weakens authority boundaries inside AOIA.

Containment status:

- Separate source authority from generated operational artifacts in future AOIA cleanup.

Safe Shared Lineage

These materials are cross-referential but can be preserved without shared canon:

- `references.bib`, `CITATION.cff`, and release manifests that point across versions
- archived zip packages and frozen release bundles
- external reviews of LSC stored as review artifacts
- historical reports documenting why LSC and MHLM were studied together

Safe handling rule:

- Preserve as archive/reference layers.
- Do not let them define the active authority of a target repo.

Conflicting Repository Roots

Observed conflicting roots:

- `WORKFLOW NOWE`
- `LLM-MHLM-Main-Project`
- `LSC-6.0`

Conflict pattern:

- more than one root claims to represent the project family

- each root embeds different mixtures of LSC, MHL, and public/audit framing
- this makes naive repo splitting dangerous because roots currently function as historical snapshots, not cl

Recursive Reference Risks

Observed recursive patterns:

- mixed roots linking to subprojects that already re-link back to the mixed root
- bridge docs under LSC continuity referencing monorepo reconstruction logic
- public bot/tooling READMEs referencing research identity while residing in science roots

Risk:

- future moves could produce circular documentation chains if archival bridge docs are promoted to canonical

Generated Artifact Pollution

Most visible generated artifact pollution:

- AOIA runtime outputs inside `/home/l/Desktop/app2terminl\_opened`
- archived bundles inside mixed science roots
- duplicate hash reports and merge reports inside `WORKFLOW NOWE/docs/reports`

Risk:

- generated state may be mistaken for canonical source
- archive products may be mistaken for live project roots

Contamination Severity Summary

High risk:

- mixed root READMEs
- migration scripts
- LSC continuity bridge docs
- public AI bot tooling inside science roots

Moderate:

- metadata files linking science, portal, and audit surfaces
- research workspace
- AOIA source/runtime co-location

Safe shared lineage:

- citations
- frozen releases
- archive manifests
- review artifacts

Operational Rule for Next Phase

No file should be migrated solely because of its current folder name.

Migration authority must follow:

1. the file's epistemic role
2. its citation obligations
3. whether it is canonic

GPT/FORENSIC_PARITY_REPORT.md

- Bytes: 5288
- SHA-256: 811a48f4ed4d9f44a0d445a39a61c0fd8d3aa8b089a71b30251589b9c1be6738

Extracted MHL Evidence: FORENSIC_PARITY_REPORT.md

Source: /home/l/Desktop/gpt/faza4/FORENSIC_PARITY_REPORT.md
Source kind: local_file
Model: GPT
Domain: AOIA

Forensic Parity Report

Date: 2026-05-23

Mode: Read-only

Scope:

- old mixed root: `/home/l/github-audit/LLM-MHLM-Main-Project`
- new roots:
 - `/home/l/Desktop/LSC-Research`
 - `/home/l/Desktop/MHLM\_MDLH`
 - `/home/l/Desktop/AOIA-Core`

Executive Result

Parity is incomplete.

The split is structurally real and GitHub-level separation exists, but the old mixed root has not been fully

Main result:

- LSC authority purity: improved and currently clean in canonical content
- MHLM authority purity: functionally correct, but still carries many legacy links to pre-separation repo id
- AOIA authority purity: correct, but parity against the old mixed root is not the right lineage baseline
- archival readiness of the old mixed root: not yet complete from a forensic parity perspective

Inventory Summary

File inventory:

- old mixed root: `535` files
- new roots union: `632` files

Hash parity:

- hashes shared between old root and new roots: `397`
- hashes present only in old root: `117`
- hashes present only in new roots: `215`

Interpretation:

- `397` shared hashes confirm substantial extraction
- `117` old-only hashes confirm unresolved leftovers
- `215` new-only hashes are expected in part because:
 - AOIA was sourced from `app2terminl\_opened`, not from the old mixed root
 - new authority docs and continuity plans were created after separation

Authority Findings

LSC

Canonical LSC content is currently free of MHLM framing in scientific content.

Measured result:

- MHLM-style terms inside canonical LSC content trees: `0`

Important caveat:

- parity is incomplete because significant LSC-side scientific assets from the old mixed root were not extra

- the largest missing block is `LSC/LSC\_data/\*\*`

MHLM / MDLH

MHLM remains allowed to reference LSC, and it does so extensively.

Measured result:

- LSC-related references inside `MHLM\_MDLH`: `1619`

This is not automatically a defect. It matches the intended asymmetry:

- `LSC` must not contain MHLM framing
- `MHLM` may reference LSC as case-study material

But:

- many MHLM files still point to historical repo identities such as `LSC\_MDLH\_PRO` and `LSC-6.0`
- this creates unresolved reference debt

AOIA

AOIA content is runtime/infrastructure-only relative to science language.

Measured result:

- science-term hits inside AOIA runtime/docs/tests: `0`

Critical parity caveat:

- `AOIA-Core` was not extracted from the old mixed root
- it was extracted from `app2terminl\_opened`
- therefore, parity against `LLM-MHLM-Main-Project` cannot validate AOIA lineage completeness

This means:

- AOIA authority purity is acceptable
- AOIA parity against the old mixed monorepo is not a meaningful completeness test

Missing Extraction Blocks

The highest-signal unresolved old-root blocks are:

1. `LSC/LSC\_data/\*\*`

- `33` old-only hashes
- includes contact datasets, experimental summaries, geometry, public source PDFs/TXT, and theoretical notes
- this is the clearest scientific extraction gap

2. `LSC/theory/\*\*`

- `25` old-only hashes
- missing theory branches include:
 - `LSC-4.2-Ultra`
 - `LSC-5.0.0`
 - parts of `LSC-6.2.0`
 - `future/LSC-6.2.3-dev`
 - `future/prism-exploratory`

3. `shared/discord-server-bot-owl/\*\*`

- `18` old-only hashes
- unresolved shared/public tooling

4. `archive/old-repositories/\*\*` and migration docs

- preserved historical material remains unassigned relative to final long-term repo policy

Broken or Stale Reference Risk

High-confidence stale-reference zones:

- [MDLH-v1.0/metadata/zenodo.json] (/home/l/Desktop/MHLM_MDLH/MDLH-v1.0/metadata/zenodo.json)
- [MDLH-v1.0/prompt-archive/prompt_registry.json] (/home/l/Desktop/MHLM_MDLH/MDLH-v1.0/prompt-archive/prompt_
- [MDLH-v1.0/README.md] (/home/l/Desktop/MHLM_MDLH/MDLH-v1.0/README.md)
- [epistemic-analysis/legacy/SESSION_CONTINUATION_2026-04-28.md] (/home/l/Desktop/MHLM_MDLH/epistemic-analysis

Observed stale targets:

- `https://github.com/luciferprosun/LSC\_MDLH\_PRO`
- `https://github.com/luciferprosun/LSC-6.0`

These are historically meaningful, but they are no longer sufficient as the forward authority map.

Runtime / Governance Bleed-Through

Observed result:

- no science-term bleed-through was found inside AOIA runtime content
- no MHLM-style framing was found in canonical LSC content trees

Unresolved bleed-through remains in the old mixed root, not in the new canonical roots:

- shared public bot tooling under `shared/discord-server-bot-owl`
- mixed migration docs under `docs/`
- mixed continuity materials under `LSC/reproducibility/continuity`

Bottom Line

The split is directionally correct but not forensically complete.

What is complete:

- GitHub-level repo separation
- canonical authority separation
- old mixed root demotion

What is not complete:

- LSC scientific asset extraction
- stale cross-references inside MHLM
- final disposition of shared/public tooling
- final disposition of mixed migration/continuity docs

Gemini/FORENSIC_ARCHITECTURE_REPORT.md

- Bytes: 8607
- SHA-256: 5a66a20f999cb8ac4949f0b0814cf0a498525d0f80377bc1da17400eb7743c1b

Extracted MHLM Evidence: FORENSIC_ARCHITECTURE_REPORT.md

Source: /home/l/Desktop/gpt/faza1/FORENSIC_ARCHITECTURE_REPORT.md

Source kind: local_file

Model: Gemini

Domain: AOIA

Forensic Architecture Report

Scope

This audit is read-only with respect to application code. The only new artifacts created are audit documents

Audit target: `/home/l/Desktop/app2terminl\_opened`

Observed repository shape:

- Active Python runtime
- Deterministic RHCSA knowledge base
- AOIA research and routing scaffolding
- Web wrapper over the same runtime
- Imported sibling frontend app under `apps/`
- Large amount of generated local state, logs, exports, and historical docs

Executive Summary

The repository has one real execution spine and several preserved side paths.

Canonical execution spine:

1. `main.py`
2. `commands/`
3. `router/local\_router.py`
4. `orchestrator/knowledge\_router.py`
5. `adaptive\_routing/epistemic\_kernel.py`
6. `providers/config.py`
7. `tools/executor.py`
8. `tools/{validator,memory,shell\_tools,filesystem\_tools,browser\_tools}.py`

This spine is coherent enough to continue development safely, but the repo around it is noisy. The largest s

Canonical Runtime

The runtime is local-first but not fully offline:

- `main.py` is the primary CLI entrypoint.
- `webapp.py` is a thin HTTP wrapper around the same `AgentRuntime`.
- `run.sh` and `run\_web.sh` are launcher wrappers only.
- `commands/local\_commands.py` provides local slash commands.
- `router/local\_router.py` handles deterministic obvious tasks before model use.
- `orchestrator/knowledge\_router.py` and `adaptive\_routing/epistemic\_kernel.py` provide local deterministic
- `tools/executor.py` is the only real action dispatcher.

This is the strongest architectural fact in the repo: execution is centralized, not spread across many execu

Stable Subsystems

Runtime core

- `main.py`
- `webapp.py`
- `tools/executor.py`
- `tools/validator.py`
- `tools/memory.py`
- `providers/config.py`

Deterministic knowledge subsystem

- `knowledge/`
- `tools/rhcsa\_search.py`
- `knowledge/rhcsa\_engine.py`
- `tools/epistemic\_registry.py`

- `provenance\_registry.json`
- `contradiction\_registry.json`

Determinism and safety layer

- `adaptive\_routing/deterministic\_router.py`
- `adaptive\_routing/config\_loader.py`
- `adaptive\_routing/epistemic\_kernel.py`
- `tests/test\_aoia\_determinism.py`
- `tests/test_epistemic_*

Duplicate Modules And Structural Drift

Documentation duplication

There are parallel document sets with overlapping authority:

- root `ARCHITECTURE.md` and `docs/ARCHITECTURE.md`
- root `CONSTRAINTS.md` and `docs/CONSTRAINTS.md`
- root `PROJECT\_STRUCTURE.md` and `docs/REPO\_STRUCTURE.md`
- `docs/ADR/` and `docs/adr/`

This is the largest non-code clarity problem. It creates competing narratives for the same system.

Memory vault duplication

Two vault-like structures exist:

- `AI\_MEMORY\_VAULT/`
- `obsidian\_vault/`

They are not equivalent. `obsidian\_vault/` is the runtime-managed active vault. `AI\_MEMORY\_VAULT/` is a manu

Validator namespace duplication

Two validators exist, but for different domains:

- `tools/validator.py` for runtime action validation
- `knowledge/validator/validator.py` for RHCSA example pack validation

This is not a bug, but the identical name increases confusion.

Placeholder, Legacy, Or Experimental Systems

Disabled orchestrator path

`orchestrator/gemini\_gemma.py` exists, but the worker path is intentionally disabled:

- `GeminiGemmaOrchestrator.gemma\_provider` starts as `None`
- `action\_for\_step()` raises if the worker is not present
- `/orchestrator on` still returns a disabled notice

This is preserved experimental architecture, not active production flow.

Legacy Gemma provider

`providers/gemma\_provider.py` still exists and contains Ollama/HuggingFace/OpenAI-compatible fallback logic,

AOIA research stubs

These modules are real code but not part of the canonical path:

- `adaptive\_routing/circadian\_router.py`
- `adaptive\_routing/environment/environment\_router.py`
- `adaptive\_routing/stdout\_logger.py`

They are referenced by docs and tests, not by `main.py`.

Web reader side utility

`tools/web\_reader.py` appears unused by the runtime and contains signs of drift:

- imports `requests` and `bs4`, which are not declared in `requirements.txt`
- uses `if name == "main"` instead of `if \_\_name\_\_ == "\_\_main\_\_"`

This is a strong dead-or-abandoned utility candidate.

Dead Code And Weakly Connected Code

Likely dead or weakly connected modules:

- `providers/gemma\_provider.py`
- `tools/web\_reader.py`
- `adaptive\_routing/circadian\_router.py`
- `adaptive\_routing/environment/environment\_router.py`
- `adaptive\_routing/stdout\_logger.py`
- top-level `validator.py` wrapper

These are not necessarily safe to delete in this phase, but they are not on the canonical runtime path.

Hidden Dependencies

Python dependencies

Declared in `requirements.txt`:

- `google-genai`
- `playwright`

Undeclared but imported:

- `requests` in `tools/web\_reader.py`
- `bs4` in `tools/web\_reader.py`

External runtime services

The app is not cloud-free in practice:

- OpenRouter
- Gemini API
- DeepSeek API
- optional Aureon-compatible backend

The runtime is local-first, but model generation depends on external providers unless local deterministic ro

Frontend subproject dependencies

`apps/flameborn-academy-codex-sparrow/` introduces a separate Node/Workers toolchain:

- `package.json`
- `wrangler.jsonc`
- Cloudflare worker scripts

This is a second ecosystem inside the repo and not integrated into the Python runtime.

Recursive Risks

Prompt-feedback recursion

`main.py` feeds runtime state, recent outputs, knowledge context, and reasoning traces back into future prompts.

Current mitigations:

- step limit in `main.py`
- deterministic local routing before model use
- explicit `I DO NOT KNOW` path
- approval boundary in `tools/executor.py`

Memory growth in-repo

Runtime state is written into source-adjacent directories:

- `memory/`
- `logs/`
- `state/`
- `obsidian\_vault/`

This does not create autonomous mutation of code, but it does create repository self-accumulation and noise.

Autonomous Behavior Risks

The repo does not currently implement autonomous agents in the strong sense, but it contains agent-shaped scaffolding.

Present risks:

- plan -> action -> result -> replan loop in `main.py`
- browser persistence in `tools/browser\_tools.py`
- multi-step model loop with shell and filesystem execution
- preserved orchestrator abstraction in `orchestrator/`

Current safety boundaries:

- manual approval for non-`respond` actions
- shell validator
- bounded loop count
- no automatic contradiction resolution
- no active self-modifying code path detected

Fake Agent Logic Risks

The largest fake-agent risk is narrative, not execution:

- A0IA research files describe richer architecture than the active runtime actually executes.
- disabled orchestrator structures

# Test Constitution

## ## Principle

AOIA tests must prove deterministic behavior before any runtime integration.

## ## Required Properties

- Same input returns same output.
- Boundary values are explicit.
- Invalid input fails fast.
- Configuration loads deterministically.
- Configuration is readonly after loading.
- Tests must not call external networks.
- Tests must not require provider keys.
- Tests must not depend on current time unless time is explicitly injected.

## ## Fail-Fast Rule

Invalid configuration or invalid pressure input should raise immediately. Silent fallbacks are not allowed in AOIA core contracts.

## ## Test Layers

Unit tests:

- pure functions
- config loading
- validation behavior

Integration tests:

- allowed only after runtime integration is approved

External tests:

- forbidden in early AOIA steps

## Current AOIA Test File

- `tests/test\_aeia\_determinism.py`

## Current Validation Focus

- `select\_depth()` determinism
- pressure threshold stability
- invalid pressure rejection
- `load\_config()` deterministic loading
- readonly config behavior
- correlation id shape

# Phase 1A Git Validation

Status: validation report

Date: 2026-05-23

Repository: `~/home/1/Desktop/AOIA-Core`

Remote: `<https://github.com/luciferprosun/AOIA-Core.git>`

## Summary

Phase 1A architecture documents are present in the canonical repository, but the repository is not fully clean.

No runtime source files are modified. No files larger than 50 MB were found. No archives or nested git repositories were found.

Because the repository is not clean under the requested criteria, no new checkpoint commit should be created.

## Repository Status

Current branch:

- `main`

Current HEAD:

- `5674fd4d25daaf8aa8c0bed1c658f9e0260678e5`

Current git status:

```text

main...origin/main

?? docs/forensic-runtime-audit/

?? state/

Modified files: - none

Staged files: - none

Untracked files: - docs/forensic-runtime-audit/CANONICAL_REFACTOR_PREP.md - docs/forensic-runtime-audit/CURRENT_RUNTIME_AUDIT.md

- docs/forensic-runtime-audit/MEMORY_CONTAMINATION_MAP.md - docs/forensic-runtime-audit/RUNTIME_BOUNDARY_VIOLATION.md
- state/model_config.json - state/providers.json

Repository Size

Working tree size: - 4.5M

Git directory size: - 2.1M

Repository size is small and does not indicate large artifact contamination.

Phase 1A Architecture Documents

Expected documents: - docs/architecture/AOIA_MEMORY_MODEL.md - docs/architecture/FORBIDDEN_MEMORY_FLOWS.md
- docs/architecture/MEMORY_LAYER_ACCESS_MATRIX.md

Validation result: - all expected documents exist in the canonical repository - no runtime files are required for these documents - no provider or routing files are modified

Important note: - These documents are already committed at HEAD 5674fd4d25daaf8aa8c0bed1c658f9e0260678e5. - They were previously pushed to `origin/main`. - This validation report does not rewrite or amend that history.

Large File Analysis

Files larger than 50 MB: - none found

Recommendation: - no Git LFS action is required for files currently present in the repository - no large file deletion or movement is required

Archives And Hidden Artifacts

Archives found in repository: - none found for `.zip`, `.tar`, `.tar.gz`, `.tgz`, `.7z`, `.rar`, or `.gz`

Hidden files found outside `.git`: - `.gitignore`

Temporary report-like files inside repository: - AOIA_CONTAMINATION_REPORT.md - runtime/knowledge/validator/validation_report.md

Assessment: - both appear to be existing tracked project documents, not new temporary contamination from Phase 1A

PDF And Binary Analysis

Tracked PDFs: - runtime/knowledge/source/RHCSA_Command_Library (1).pdf - 153760 bytes

Duplicated PDFs: - none detected

Tracked `.pyc` files: - none

Ignored local `.pyc` files are present under runtime `__pycache__` directories. They are excluded by `.gitignore`:

```
__pycache__/  
*.pyc  
.pytest_cache/  
.venv/
```

Assessment: - no tracked Python bytecode contamination detected - ignored local bytecode files do not block the checkpoint

Nested Git Repository Check

Nested `.git` directories inside the repository: - none found

Assessment: - no nested repository contamination detected

Duplicate Detection Outside Repository

Accidental duplicate architecture documents were found outside the repository:

- /home/1/docs/architecture/AOIA_MEMORY_MODEL.md
- /home/1/docs/architecture/FORBIDDEN_MEMORY_FLOWS.md
- /home/1/docs/architecture/MEMORY_LAYER_ACCESS_MATRIX.md

Assessment: - these are duplicates of the Phase 1A architecture documents - they are outside /home/1/Desktop/AOIA-Core
- they should not be treated as canonical - they should be removed or archived only after explicit operator approval

Related temporary report outside repository: - /home/1/Desktop/CODEX_RAPORT_1925.md

Assessment: - this is an operator-requested desktop report, not repository content - it is outside the AOIA-Core git tree

Untracked Runtime Risk Files

Untracked audit documents:

- docs/forensic-runtime-audit/CANONICAL_REFACTOR_PREP.md
- docs/forensic-runtime-audit/CURRENT_RUNTIME_TOPOLOGY.md
- docs/forensic-runtime-audit/MEMORY_CONTAMINATION_MAP.md
- docs/forensic-runtime-audit/RUNTIME_BOUNDARY_VIOLATIONS.md

Untracked runtime state files:

- state/model_config.json
- state/providers.json

Risk assessment: - docs/forensic-runtime-audit/ may be legitimate architecture audit material, but it is untracked and outside the requested Phase 1A commit set - state/ contains mutable runtime configuration/state and should not be committed without a dedicated policy - these files prevent a fully clean checkpoint under the requested validation rules

Recommendation: - decide explicitly whether docs/forensic-runtime-audit/ should be committed as architecture audit evidence or moved to a report/archive policy - add runtime state paths to ignore policy or move them out of source authority boundaries in a later implementation phase - do not include state/ in a Phase 1A architectural checkpoint

Runtime Change Verification

Runtime files modified: - none

Provider files modified: - none

Routing files modified: - none

Memory runtime files modified: - none

Assessment: - no runtime behavior was changed by this validation step

Staging Verification

Current staged files: - none

Expected Phase 1A staging set, if a clean checkpoint were performed: - docs/architecture/AOIA_MEMORY_MODEL.md - docs/architecture/FORBIDDEN_MEMORY_FLOWS.md - docs/architecture/MEMORY_LAYER_ACCESS_MATRIX.md - 'docs [excerpt capped; full local file indexed by path and SHA-256]

LSC 6.3.0 Published Record

Date: 2026-05-05

Zenodo

- Record: <https://zenodo.org/records/20037838>
- Version DOI: <https://doi.org/10.5281/zenodo.20037838>
- Concept DOI: <https://doi.org/10.5281/zenodo.19780615>

Publication Role

This is a new Zenodo version under the existing LSC concept DOI. It continues the LSC 6.0 -> LSC 6.2.0 line as a single LSC project.

The LSC v1.2.0 computational record remains a supplementary reproducibility record, not a separate primary theory line.

Uploaded Files

- `LSC\_6\_3\_0\_UNIFIED\_BEST2\_UPDATE.pdf`
- `LSC\_6\_3\_0\_unified\_zenodo\_package.zip`

The draft also preserved the inherited LSC 6.2.0 files for version continuity.
